

# MCAL User Manual for Can\_17\_McmCan

## 32-bit TriCore™ AURIX™ TC3xx microcontroller

### About this document

#### Scope and purpose

This User Manual is intended to enable users to integrate the Microcontroller Abstraction Layer (MCAL) software for the TriCore™ AURIX™ family of 32-bit microcontrollers.

This document describes responsibilities of integrator in-charge of integrating MCAL software with the basic software (BSW) stack. This document also provides detailed information on safety, configuration and functions along with examples of usage of significant features.

*Note: Detailed information about package installation, safety and other generic information that are common across all modules are provided in MCAL User Manual General.*

#### Intended audience

This document is intended for anyone using the Can\_17\_McmCan module of the TC3xx MCAL software.

#### Document conventions

**Table 1** Conventions

Convention	Explanation
<b>Bold</b>	Emphasizes heading levels, column headings, table and figure captions, screen names, windows, dialog boxes, menus, sub-menus
<i>Italics</i>	Denotes variable(s) and reference(s)
Courier	Denotes APIs, functions, interrupt handlers, events, data types, error handlers, file/folder names, directories, command line inputs, code snippets
New	
>	Indicates that a cascading sub-menu opens when you select a menu item
[cover parentID=<alpha numeric value>]	Used for traceability completeness. Reader should ignore these.

#### Reference documents

This User Manual should be read in conjunction with the following documents:

- AURIX™ TC3xx User Manual User Manual General
- Specification of CAN Driver, AUTOSAR\_SWS\_CAN\_Driver, AUTOSAR Release 4.2.2
- Specification of CAN Driver, AUTOSAR\_SWS\_CAN\_Driver, AUTOSAR Release 4.4.0

**1 Can\_17\_McmCan driver****1 Can\_17\_McmCan driver****1.1 User information****1.1.1 Description**

The CAN driver is responsible for providing standard CAN communication services specified by AUTOSAR 4.2.2 and 4.4.0. The M\_CAN unit is the underlying CAN hardware unit, which consists of nodes (called as controllers in AUTOSAR) sharing the message RAM (called as hardware objects in AUTOSAR). The CAN driver provides services for:

- Initialization of CAN controllers to control the behavior and state of the CAN controllers
- Setting and modifying the baud-rate configuration of the CAN controller
- CAN and CAN FD frame transmission and reception is supported
- Successful frame transmission notification, reception of dedicated and FIFO messages and bus-off event notification in the polling and interrupt modes
- Data reception using the receive FIFO functionality
- Pretended networking mode handling
- Multiple read/write period functionality support
- Multiplexed transmission using Tx queue
- Individual interrupt lines are routed for the handling of the following events of each CAN node:
  - Bus-off event handling - Transmit event handling - Dedicated message receive event handling - Receive FIFO 0 and FIFO 1 watermark and FIFO full event handling.
- Mixed mode handling for Rx and Tx processing

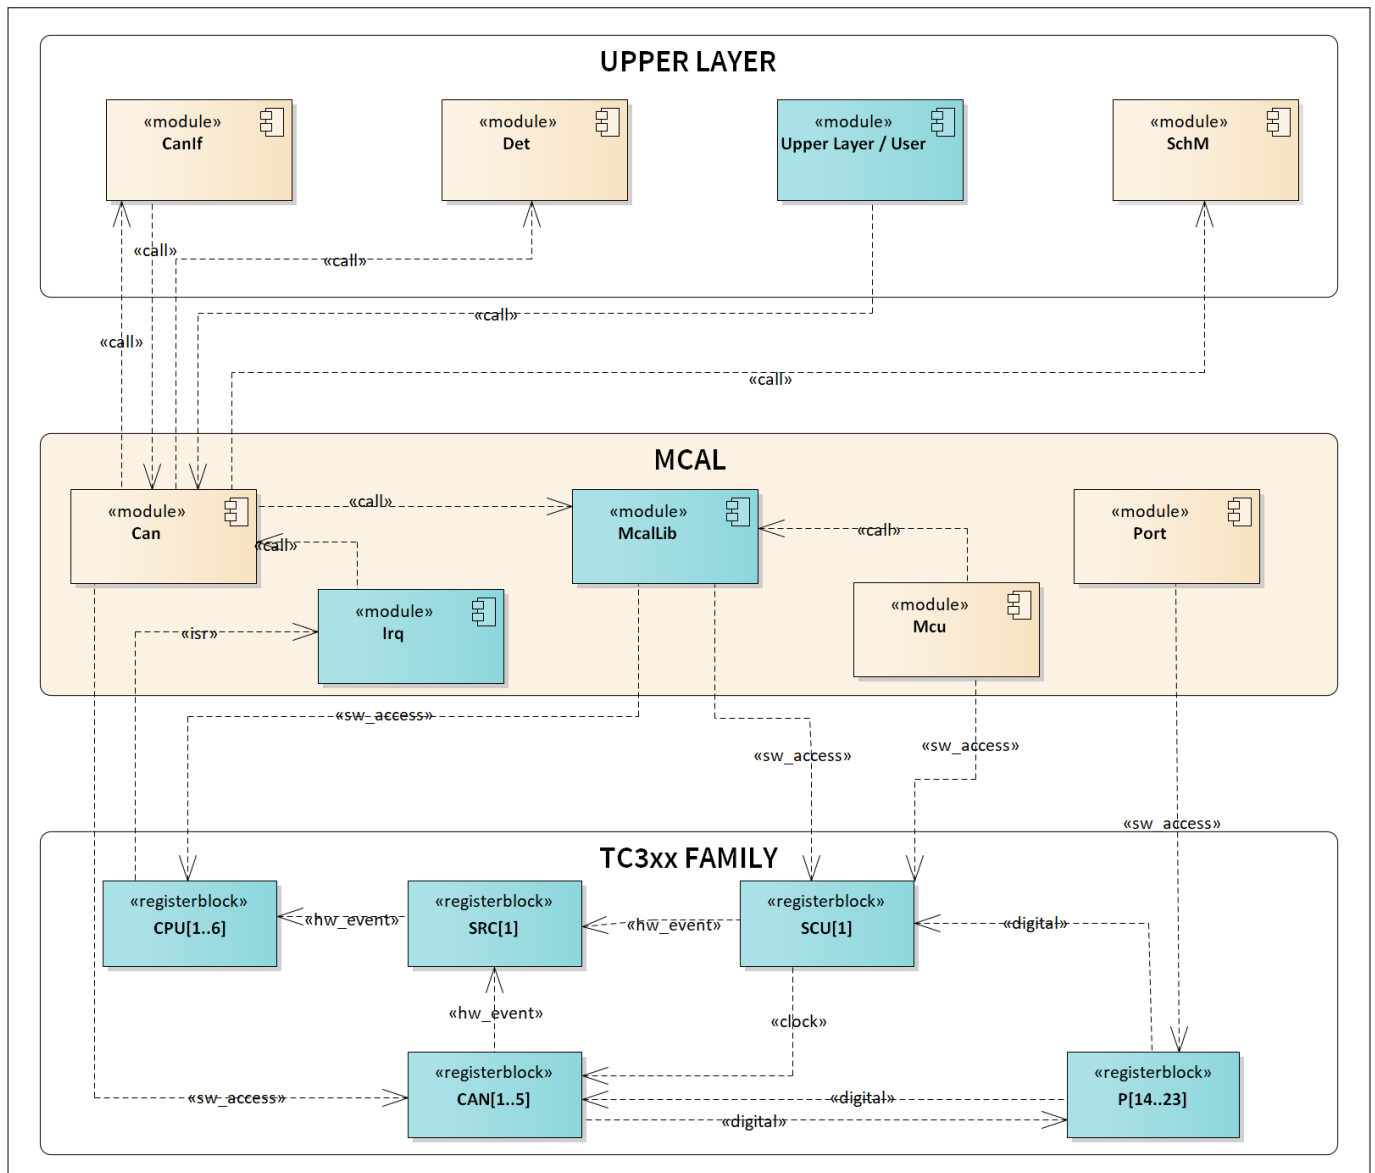

The CAN driver is delivered as a Post-Build variant. Therefore, the driver supports configuration parameters with pre-compile and post-build configuration classes. The APIs provided by the CAN driver are multicore capable, which means that they may be invoked from several cores simultaneously. The availability of the APIs, configuration parameters and the error handling are dependent on the AUTOSAR version being used.

**1.1.2 Hardware-software mapping**

This section describes the system view of the CAN driver and peripherals administered by it.

## 1 Can\_17\_McmCan driver

**Figure 1 Mapping of hardware-software interfaces**

### 1.1.2.1 M\_CAN: primary hardware peripheral

#### Hardware functional features

The CAN driver uses the M\_CAN to communicate according to the ISO 11898-1. In addition, the M\_CAN supports communication according to the CAN FD protocol specification 1.0. The key hardware functional features used by the driver are:

- All the CAN controllers and message RAM available in the M\_CAN module are used to implement the CAN driver
- CAN FD with up to 64 data bytes supported
- Up to 64 dedicated receive buffers
- Up to 32 dedicated transmit buffers
- Two configurable receive FIFOs

---

## 1 Can\_17\_McmCan driver

- Configurable transmit queue
- Four Individual interrupts are configured per controller. These are dedicated Rx, Rx FIFOs, Tx and bus-off events

The unsupported features of the M\_CAN are:

- Event-synchronized time-triggered communication
- CAN error logging
- High priority messages

### Users of the hardware

The CAN driver exclusively utilizes the M\_CAN module.

### Hardware diagnostic features

The SMU alarms configured for the M\_CAN are not monitored by the CAN driver.

### Hardware events

The CAN driver uses the following hardware events from the M\_CAN IP:

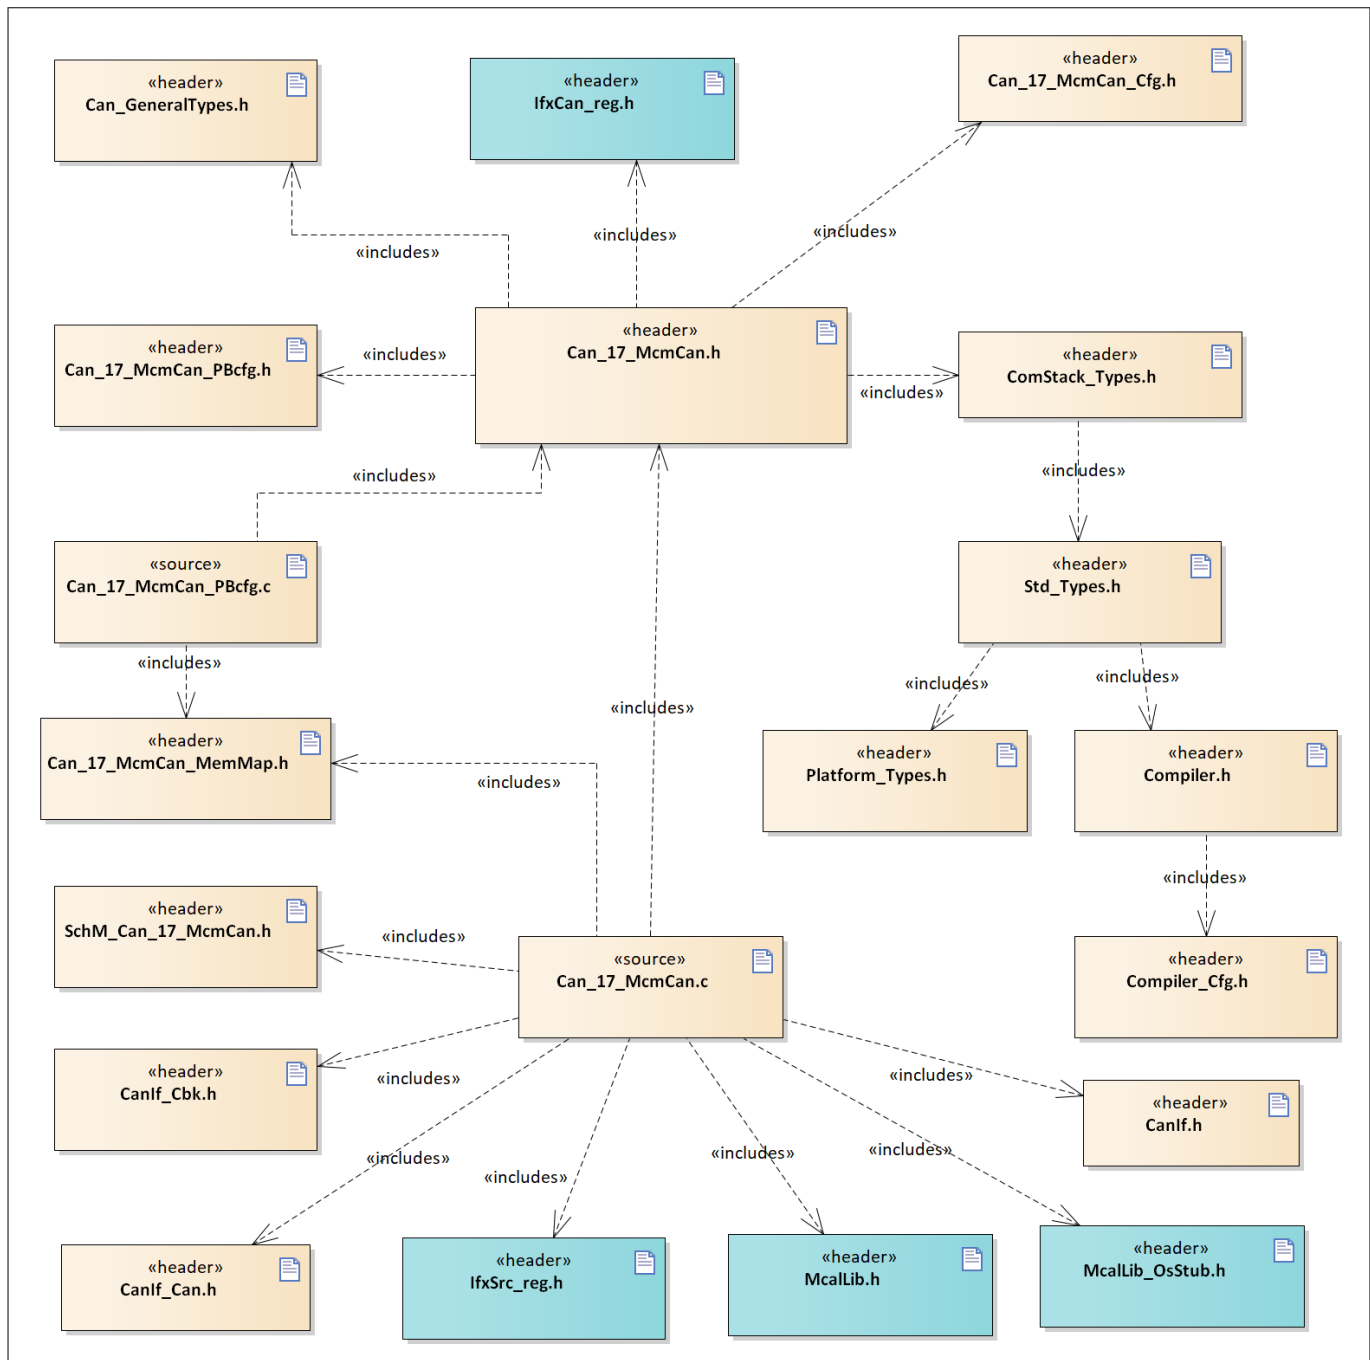

- Successful transmission of a CAN / CAN FD frame is notified by flag (relevant bit in the IR register) as well as interrupt. The CAN driver uses the TxEvent FIFO new entry to handle notifications to upper layer
- Successful reception of a CAN / CAN FD frame is notified by flag (relevant bit in the IR register) as well as interrupt. The CAN driver uses the receive interrupt raised
- Bus-Off event is notified by flag (relevant bit in the IR register) as well as interrupt. The CAN driver uses the bus-off interrupt which is raised
- Both Rx FIFO0 watermark reached, RxFIFO0 Full, RxFIFO 1 watermark reached event, RxFIFO1 Full events are routed to same ISR. All the listed flags are handled in the CAN driver to process the received data through FIFO

## 1.1.3 File structure

### 1.1.3.1 C file structure

This section provides details of the C files of the CAN driver.

## 1 Can\_17\_McmCan driver

**Figure 2** **Can\_C\_File\_Structure-1.png**

### Table 2 C file structure

File name	Description
CanIf.h	Header file containing the exported interfaces of CanIf
CanIf_Can.h	Header file containing declarations of the CanIf callbacks <i>Note: This file is available only for AUTOSAR version 4.4.0</i>
CanIf_Cbk.h	Header file containing declarations of the CanIf callbacks. <i>Note: This file is available only for AUTOSAR version 4.2.2</i>
Can_17_McmCan.c	Implementation of the CAN driver functionality

## 1 Can\_17\_McmCan driver

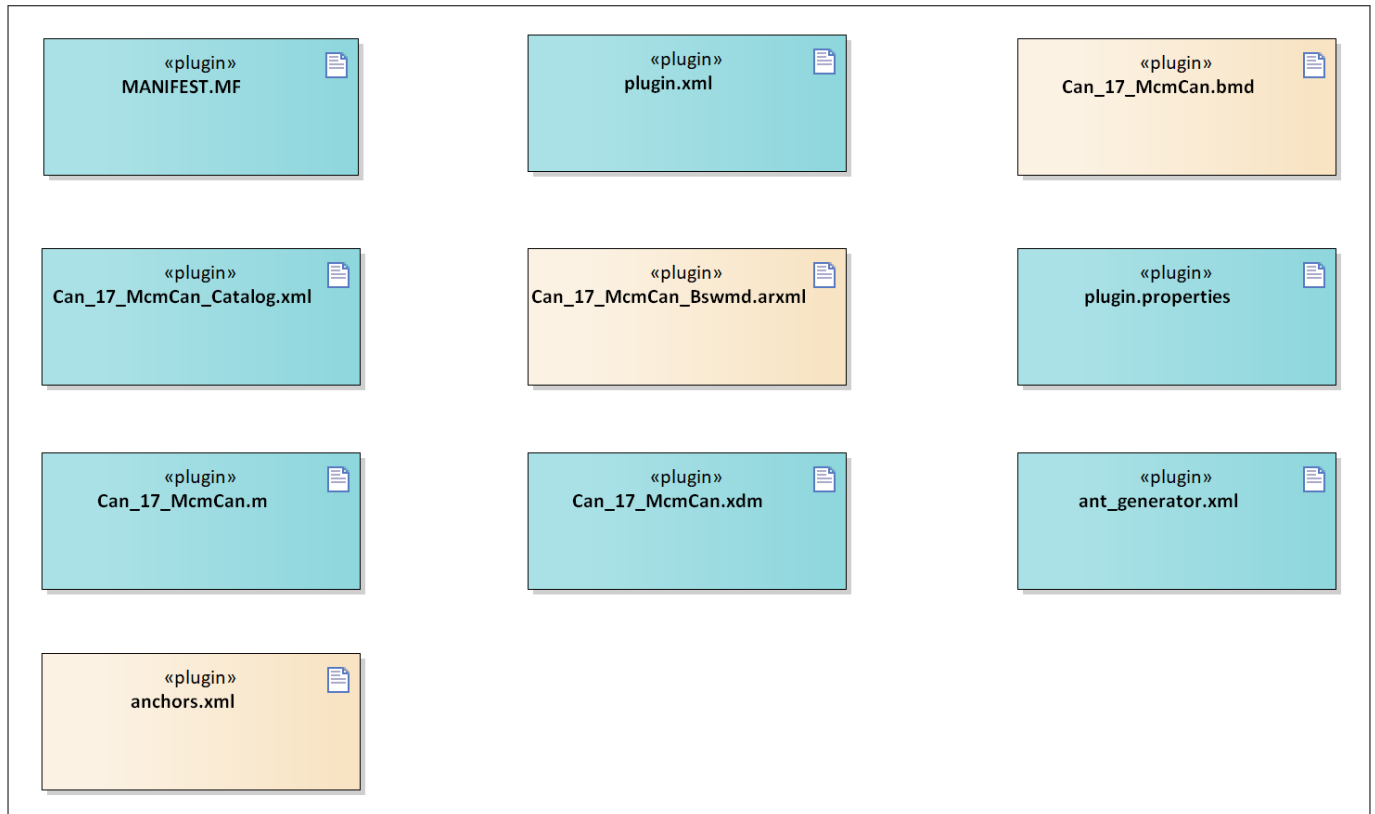

**Table 2 C file structure (continued)**

File name	Description
Can_17_McmCan.h	Export of the CAN driver functionality
Can_17_McmCan_Cfg.h	The configuration data of the CAN driver is declared here <i>Note: All pre-compile time configuration parameters shall be defined as pre-processor directives (#define)</i>
Can_17_McmCan_MemMap.h	Mapping of code and data (variables, constant variables) to specific memory sections
Can_17_McmCan_PBcfg.c	Post Build configuration data of the CAN driver is defined here
Can_17_McmCan_PBcfg.h	Header file (generated) containing declaration of the post-build configuration data structures
Can_GeneralTypes.h	Contains all types and constants that are shared among the AUTOSAR CAN modules Can, CanIf and CanTrcv
ComStack_Types.h	Type Definition for Com stack
Compiler.h	Provides abstraction from compiler-specific keywords
Compiler_Cfg.h	Configuration header file for compiler abstraction
IfxCAN_reg.h	SFR header file for CAN
IfxSrc_reg.h	SFR header file for Interrupt Controller
McalLib.h	Static header file defining prototypes of data structure and APIs exported by the MCALLIB.
McalLib_OsStub.h	McalLib_OsStub.h provides macros to support user mode of Tricore. This shall be included by other drivers to call OS APIs.
Platform_Types.h	Platform-specific type declaration file as defined by AUTOSAR
SchM_Can_17_McmCan.h	Functions to enable/disable interrupts are declared here.
Std_Types.h	Standard type declaration file as defined by AUTOSAR. It is independent of compiler or platform.

### 1.1.3.2 Code generator plugin files

This section provides details of the code generator plugin files of the CAN driver.

## 1 Can\_17\_McmCan driver

**Figure 3** Can\_Code\_Generator\_Plugin\_Files-1.png

**Table 3** Code generator plugin files

File name	Description
Can_17_McmCan.bmd	AUTOSAR format XML data model schema file for the CAN driver
Can_17_McmCan.m	Code template macro file for the CAN driver
Can_17_McmCan.xdm	Tresos format XML data model schema file
Can_17_McmCan_Bswmd.arxml	AUTOSAR format module description file
Can_17_McmCan_Catalog.xml	AUTOSAR format catalog file
MANIFEST.MF	Tresos plugin support file containing the metadata for the CAN driver
anchors.xml	AUTOSAR format module description file
ant_generator.xml	Tresos support file to generate and rename multiple post-build configuration when using variation point
plugin.properties	Tresos plugin support file for the CAN driver
plugin.xml	Tresos plugin support file for the CAN driver

### 1.1.4 Integration hints

This section lists the key points, that an integrator or user of the CAN driver must consider.

#### 1.1.4.1 Integration with AUTOSAR stack

This section lists the modules, which are not part of MCAL, but required to integrate the CAN driver.

---

## 1 Can\_17\_McmCan driver

- **EcuM:**

The ECU Manager module is a part of the AUTOSAR stack that manages common aspects of ECU. Specifically, in the context of MCAL, EcuM is used for initialization and de-initialization of the software drivers. The EcuM module provided in the MCAL package is a stub code and needs to be replaced with a complete EcuM module during the integration phase.

- **CAN Interface (CanIf):**

The CanIf module is a part of the AUTOSAR stack that provides upper layers a hardware independent interface to the CAN communication system comprising multiple CAN controllers.

The CanIf\_Cbk.c and CanIf\_Cbk.h files are provided as stub code and needs to be replaced with complete CanIf module during integration phase. The CAN driver uses the APIs of CanIf to provide notifications as listed.

CanIf\_ControllerModeIndication(): Notification for a successful state transition that was triggered for a controller

CanIf\_TxConfirmation(): Notification for a successfully processed transmission of a CAN Tx pdu.

CanIf\_RxIndication(): Notification for a successful reception of a received CAN Rx l-pdu to the CanIf after passing all filters and validation checks.

CanIf\_ControllerBusOff(): Notification for a Controller BusOff event referring to the corresponding CAN Controller.

CanIf\_CurrentIcomConfiguration(): Notification to inform about the change of the Icom configuration of a CAN controller.

CanIf\_TriggerTransmit(): Within this API, the CanIf shall check whether the available data fits into the buffer size reported by PduInfoPtr->SduLength. If it fits, it shall copy its data into the buffer provided by PduInfoPtr.

- **Memory mapping:**

Memory mapping is a concept from AUTOSAR that allows relocation of text, variables, constants and configuration data to user specific memory regions. To achieve this, all the re-locatable elements of the driver are encapsulated in different memory-section macros. These macros are defined in the Can\_17\_McmCan\_MemMap.h.

The file Can\_17\_McmCan\_MemMap.h file is provided in the MCAL package as a stub code. The integrator must place appropriate compiler pragmas within the memory-section macros. The pragmas ensure that the elements are re-located to the correct memory region. A sample implementation listing the memory-section macros is shown as follows.

## 1 Can\_17\_McmCan driver

- **DET:**

The DET module is a part of the AUTOSAR stack that handles all the development and runtime errors reported by the BSW modules. The CAN driver reports all the development errors to the DET module through the `Det_ReportError()` API. The user of the CAN driver must process all the errors reported to the DET module through the API `Det_ReportError()`.

The files `Det.h` and `Det.c` are provided in the MCAL package as a stub code and needs to be replaced with a complete DET module during the integration phase.

- **DEM:**

The DEM module is not required for integrating the CAN driver.

- **SchM:**

## 1 Can\_17\_McmCan driver

The SchM module is a part of the RTE that manages the Basic Software Scheduler. The CAN driver uses the exclusive areas defined in SchM\_Can\_17\_McmCan.h to protect the SFRs and variables from concurrent accesses from different threads. The SchMs identified for the CAN driver are:

CanWrMO

IcomMsgCntrVal

The SchM\_Can\_17\_McmCan.h and SchM\_Can\_17\_McmCan.c files are provided in the MCAL package as an example code and needs to be updated by the integrator. The user must implement the SchM functions defined by the CAN driver as suspend / resume of interrupts for the CPU on which the API is invoked. A sample implementation of the SchM functions is depicted below:

```

/**** Sample implementation of SchM_Can_17_McmCan.c ****/
void SchM_Enter_Can_17_McmCan_CanWrMO()
{
    /* Start critical section */
    SuspendAllInterrupts(); /* Suspend CPU core interrupts */
}

void SchM_Exit_Can_17_McmCan_CanWrMO()
{
    /* End of critical section */
    ResumeAllInterrupts(); /* Resume CPU core interrupt */
}

void SchM_Enter_Can_17_McmCan_IcomMsgCntrVal()
{
    /* Start critical section */
    SuspendAllInterrupts(); /* Suspend CPU core interrupts */
}

void SchM_Exit_Can_17_McmCan_IcomMsgCntrVal()
{
    /* End of critical section */
    ResumeAllInterrupts(); /* Resume CPU core interrupt */
}

```

- **Safety error:**

The CAN driver does not report any safety errors.

- **Notifications and call-backs:**

The CAN driver does not implement any notifications. However, it does report transmit confirmation, mode change indication, bus-off and wake up identification, pretended network activation or de-activation completion and successful reception through the CanIf module call backs.

- **Callout:**

The CAN driver provides the prototype of the LPDU callout function. The callout name and implementation is defined by the application using the parameter CanLPduReceiveCalloutFunction.

- **Operating System:**

OS or application must ensure correct type of service and interrupt priority is configured in the SR register. Enabling and disabling of the interrupts must also be managed by the OS or application.

## 1 Can\_17\_McmCan driver

The operating system files provided by MCAL package is only an example code and must be updated by the integrator with actual OS files for desired function.

### 1.1.4.2 Multicore and Resource Manager

The CAN driver supports execution of its APIs simultaneously from all CPU cores. The user should allocate resources of CAN to CPU cores at pre-compile time using the Resource Manager module. The following are the key points to be considered with respect to multicore in the driver:

- CAN controllers of the CAN driver can be allocated to CPU cores at pre-compile time.
- CAN controllers that are not allocated to a CPU core shall be by default allocated to the master core.
- Initialization of the CAN controller must start with the master core initialization only after the successful initialization of the master core should there be a trigger for a slave core initialization. CAN driver of the slave cores can be initialized simultaneously.
- De-initialization of the CAN driver for different slave cores can be initiated simultaneously. The master core de-initialization of the CAN driver should be carried out only after the de-initialization of the CAN driver in all the slave cores.
- DETs will be raised in case APIs are invoked with mismatch of CPU core and controller IDs or hardware object IDs.
- Interrupts raised by a hardware group must be serviced by the CPU core to which the hardware group has been allocated to.
- Locating constants, variables and configuration data to correct memory space should be done by the user. Memory sections are marked GLOBAL (common to all cores) and CORE[x] (specific to a CPU core). The following should be considered by the user to ensure better performance of the driver:

#### Code section:

The executable code of CAN driver is placed under single MemMap section. It can be relocated to any PFlash region.

#### Data section:

The RAM variable memory sections marked as specific to a core should be relocated to the DSPR/DLMU of the same core. The sections marked as global should be relocated to the non-cached LMU region. In devices with no LMU, non-cached DSPR can be used.

#### Configuration data and constants:

The configuration data sections marked as specific to a core should be re-located to the PFlash of the same core. The sections marked as global should be relocated to the PFlash of the master core.

*Note: Relocating of code, data or constants to a distant memory region would impact execution timings.*

*Note: If the driver operates from a single (master) core, all the sections may be relocated to the PFlash/DSPR/DLMU of the same CPU core.*

### 1.1.4.3 MCU support

The CAN driver is dependent on the MCU driver for clock configuration. The initialization of CAN driver must be started only after the completion of MCU initialization. The following must be considered while configuring the MCU driver in EB Tresos:

- McuMCanClockSourceSelection - Used to select the different clock source.
- McuMCanFrequency - To be set if the McuMCanClockSourceSelection is MCAN\_CLOCK\_SOURCE\_MCANI\_SEL1.
- McuMainOscillatorFrequency - To be set if the McuMCanClockSourceSelection is MCAN\_CLOCK\_SOURCE\_OSC\_SEL2.

## 1 Can\_17\_McmCan driver

### 1.1.4.4 Port support

The PORT driver configures the port pins of the entire microcontroller. The user must configure port pins used by the CAN driver through the PORT configuration and initialize the port pins prior to invoking of CAN initialization.

The TxD and RxD pins (corresponding to the Rx Pin selection made in CAN driver) of the different CAN controllers must be configured with respective direction and configuration in the PORT driver.

### 1.1.4.5 DMA support

The CAN driver does not use any services provided by the DMA driver.

### 1.1.4.6 Interrupt connections

The interrupt connections of the CAN driver are described in this section.

**Table 4 Handling CAN interrupt lines:**

Controller	Signal	Service type	Function to be called
Controller 0	CAN0SR0_ISR	Service on CAN data Reception through dedicated buffer.	Can_17_McmCan_IsrReceiveHandler(CAN_17_MCMCAN_HWMCMKERNEL0_ID, CAN_17_MCMCAN_HWMCMCONTROLLER0_ID);
Controller 0	CAN0SR1_ISR	Service for the transmission completion new entry event on TX FIFO Event.	Can_17_McmCan_IsrTransmitHandler(CAN_17_MCMCAN_HWMCMKERNEL0_ID, CAN_17_MCMCAN_HWMCMCONTROLLER0_ID);
Controller 0	CAN0SR2_ISR	Service on CAN controller within Bus Off mode.	Can_17_McmCan_IsrBusOffHandler(CAN_17_MCMCAN_HWMCMKERNEL0_ID, CAN_17_MCMCAN_HWMCMCONTROLLER0_ID);
Controller 0	CAN0SR3_ISR	Service on CAN receive FIFO water mark level or FIFO full level reached on Rx FIFO0 or Rx FIFO1.	Can_17_McmCan_IsrRxFIFOHandler(CAN_17_MCMCAN_HWMCMKERNEL0_ID, CAN_17_MCMCAN_HWMCMCONTROLLER0_ID);
Controller 1	CAN0SR4_ISR	Service on CAN data Reception through dedicated buffer.	Can_17_McmCan_IsrReceiveHandler(CAN_17_MCMCAN_HWMCMKERNEL0_ID, CAN_17_MCMCAN_HWMCMCONTROLLER1_ID);
Controller 1	CAN0SR5_ISR	Service for the transmission completion new entry event on TX FIFO Event.	Can_17_McmCan_IsrTransmitHandler(CAN_17_MCMCAN_HWMCMKERNEL0_ID, CAN_17_MCMCAN_HWMCMCONTROLLER1_ID);
Controller 1	CAN0SR6_ISR	Service on CAN controller within Bus Off mode.	Can_17_McmCan_IsrBusOffHandler(CAN_17_MCMCAN_HWMCMKERNEL0_ID, CAN_17_MCMCAN_HWMCMCONTROLLER1_ID);

Controller 18	CAN4SR10_ISR	Service on CAN controller within Bus Off mode.	Can_17_McmCan_IsrBusoffH andler(CAN_17_MCMCAN_HWM CMKERNEL4_ID,CAN_17_MCMC AN_HWMCMCONTROLLER2_ID);
Controller 18	CAN4SR11_ISR	Service on CAN receive FIFO water mark level or FIFO full level reached on Rx FIFO0 or Rx FIFO1.	Can_17_McmCan_IsrRxFIFOH andler(CAN_17_MCMCAN_HWM CMKERNEL4_ID,CAN_17_MCMC AN_HWMCMCONTROLLER2_ID);

## 1 Can\_17\_McmCan driver

**Table 4 Handling CAN interrupt lines: (continued)**

Controller 19	CAN4SR12_ISR	Service on CAN data Reception through dedicated buffer.	Can_17_McmCan_IsrReceiveHandler(CAN_17_MCMCAN_HWMCMKERNEL4_ID, CAN_17_MCMCAN_HWMCMCONTROLLER3_ID);
Controller 19	CAN4SR13_ISR	Service for the transmission completion new entry event on TX FIFO Event.	Can_17_McmCan_IsrTransmitHandler(CAN_17_MCMCAN_HWMCMKERNEL4_ID, CAN_17_MCMCAN_HWMCMCONTROLLER3_ID);
Controller 19	CAN4SR14_ISR	Service on CAN controller within Bus Off mode.	Can_17_McmCan_IsrBusoffHandler(CAN_17_MCMCAN_HWMCMKERNEL4_ID, CAN_17_MCMCAN_HWMCMCONTROLLER3_ID);
Controller 19	CAN4SR15_ISR	Service on CAN receive FIFO water mark level or FIFO full level reached on Rx FIFO0 or Rx FIFO1.	Can_17_McmCan_IsrRxFIFOHandler(CAN_17_MCMCAN_HWMCMKERNEL4_ID, CAN_17_MCMCAN_HWMCMCONTROLLER3_ID);

Invoking of interrupt handlers provided by the driver must be done by the user. A sample invocation for controller 0, dedicated Rx interrupt is shown as follows:

```
#include "Can_17_McmCan.h"
ISR(CAN0SR0_ISR)
{
/* Enable Global Interrupts */
ENABLE();

/* Call CAN Rx Interrupt function for dedicated buffer */

Can_17_McmCan_IsrReceiveHandler(CAN_17_MCMCAN_HWMCMKERNEL0_ID, CAN_17_MCMCAN_HWMCMCONTROLLER0_ID)
;
}
```

## 1 Can\_17\_McmCan driver

### 1.1.4.7 Example usage

#### Configuring the driver and related modules

The AUTOSAR configuration parameter CanControllerBaseAddress is used with a selection of address for the mapping of CAN controller in the hardware to the configured CAN controller Id.

Note: Kernel specific RAM allocation per controller is based on the CAN hardware objects allocated to that controller. In the case of a controller with FD baudrate configured the RAM allocated per hardware object is 4 times higher. Hence, in order to have an optimised RAM memory utilisation it is recommended that a controller with FD baudrate configured have only hardware objects that use CAN FD communication.

#### Configuring of CAN hardware object

The MCMCAN hardware is supported with Rx FIFO and dedicated Rx buffer for reception and Tx Queue and Tx dedicated buffer for the transmission operation. The user can select the hardware object buffer type while configuring hardware object handler (HOH).

The following rules are considered while configuring the buffer type selection for HRH and HTH:

- If the CanObjectType value is configured with RECEIVE and CanHwObjectCount value is equal to 1 then the buffer type of HRH is assigned as Rx dedicated buffer.
- If the CanObjectType value is configured with RECEIVE and CanHwObjectCount value is greater than 1 then the buffer type of HRH is assigned as Rx FIFO. First instance shall be considered with buffer type as Rx FIFO0 and if second one is available for the same controller, it is considered with buffer type as Rx FIFO1.
- The user can configure Rx dedicated buffer or Rx FIFO (0 and 1) or the combination of the two types of the receive operations in any order.
- The user can configure Tx dedicated buffer or Tx Queue or the combination of the two types of the transmit operations in any order.
- If the CanObjectType value is configured with TRANSMIT and CanHwObjectCount value is greater than 1 then the buffer type of HTH is assigned as Tx Queue. The CanMultiplexedTransmission check needs to be done to make CanHwObjectCount value greater than 1 for a TRANSMIT message.
- If the CanObjectType value is configured with TRANSMIT and CanHwObjectCount value is equal to 1 then the buffer type of HTH is assigned as Tx dedicated buffer.
- In case Rxprocessing or Txprocessing is configured as MIXED at least one of the hardware object should be configured to polling and another one should be configured to interrupt.

#### CanObjectId configuration rules

- CanObjectId shall be unique and shall start with 0 and continue without any gap
- HRHs (CanObjectId) belonging to a controller shall be grouped together.
- HTHs (CanObjectId) belonging to a controller shall be grouped together.

Ensure HRHs of all controllers are grouped before the HTHs of all controllers, then the entire HRH id shall have lower CanObjectId than all HTH.

## 1 Can\_17\_McmCan driver

### Initializing the CAN driver

```
/* Mcu Initialization */
Mcu_Init(&Mcu_Config);
Mcu_InitClock(0U);
while(Mcu_GetPllStatus() != MCU_PLL_LOCKED);
Mcu_DistributePllClock ();
/* Port Initialization */
Port_Init(&Port_Config);
/* CAN Initialization */
Can_17_McmCan_Init(&Can_17_McmCan_Config);
/* Further APIs of CAN driver can be called now */
```

### CAN controller mode change

After CAN initialization the following sequence may be followed.

```
/* Set the controller with state as START */
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_0,CAN_T_START);
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_1,CAN_T_START);
```

### Disabling and enabling CAN controller interrupts

```
/* Disable the interruption by CAN event */
Can_17_McmCan_DisableControllerInterrupts(Can_17_McmCanConf_CanController_CanController_0);
/* Request Write operation */
Can_17_McmCan_Write(10, &PduInfo_ExtId[0]) ;
/* Enable the interruption by CAN event */
Can_17_McmCan_EnableControllerInterrupts(Can_17_McmCanConf_CanController_CanController_0);
/* Notification can be expected now */
```

### Re-initializing CAN controller baudrate

```
/* Set the controller with state as STOP */
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_0,CAN_T_STOP);
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_1,CAN_T_STOP);
/* Set the baudrate */
#if (CAN_17_MCMCAN_SET_BAUDRATE_API == STD_ON)
Can_17_McmCan_SetBaudrate(Can_17_McmCanConf_CanController_CanController_0, 0);
#endif

/* Set the baudrate */
#if (CAN_17_MCMCAN_SET_BAUDRATE_API == STD_ON)
Can_17_McmCan_SetBaudrate(Can_17_McmCanConf_CanController_CanController_1, 0);
#endif
/* Set the controller with state as START */
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_0,CAN_T_START);
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_1,CAN_T_START);
```

## 1 Can\_17\_McmCan driver

### Activating and de-activating the pretended networking

```

/* Set the controller with state as START */
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_0,CAN_T_START);
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_1,CAN_T_START);
/* Activate Pretended networking */
#if (CAN_17_MCMCAN_PUBLIC_ICOM_SUPPORT == STD_ON)
Can_17_McmCan_SetIcomConfiguration(Can_17_McmCanConf_CanController_CanController_0, 1);
#endif
/* Activate Pretended networking */
#if (CAN_17_MCMCAN_PUBLIC_ICOM_SUPPORT == STD_ON)
Can_17_McmCan_SetIcomConfiguration(Can_17_McmCanConf_CanController_CanController_1, 2);
#endif

/* Deactivate Pretended networking */
#if (CAN_17_MCMCAN_PUBLIC_ICOM_SUPPORT == STD_ON)
Can_17_McmCan_SetIcomConfiguration(Can_17_McmCanConf_CanController_CanController_0, 0);
#endif
/* Deactivate Pretended networking */
#if (CAN_17_MCMCAN_PUBLIC_ICOM_SUPPORT == STD_ON)
Can_17_McmCan_SetIcomConfiguration(Can_17_McmCanConf_CanController_CanController_1, 0);
#endif

```

### De-initializing the CAN driver

```

/* Mcu Initialization */
Mcu_Init(&Mcu_Config);
Mcu_InitClock(0U);
while(Mcu_GetPllStatus() != MCU_PLL_LOCKED);
Mcu_DistributePllClock ();
/* Port Initialization */
Port_Init(&Port_Config);
/* CAN Initialization */
Can_17_McmCan_Init(&Can_17_McmCan_Config);

/* Set the controller with state as START */
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_0,CAN_T_START);
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_1,CAN_T_START);

/* Data transmission by Controller 0 to 1 */
Can_17_McmCan_Write(8, &PduInfo_1[0]) ;

Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_0,CAN_T_STOP);
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_1,CAN_T_STOP);

/* Call CAN de-Initialization function */
Can_17_McmCan_DeInit();

```

## 1 Can\_17\_McmCan driver

### Transmission and reception in polling Mode

```

/* Mcu Initialization */
Mcu_Init(&Mcu_Config);
Mcu_InitClock(0U);
while(Mcu_GetPllStatus() != MCU_PLL_LOCKED);
Mcu_DistributePllClock ();
/* Port Initialization */
Port_Init(&Port_Config);
/* CAN Initialization */
Can_17_McmCan_Init(&Can_17_McmCan_Config);

/* Set the controller with state as START */
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_0,CAN_T_START);
Can_17_McmCan_SetControllerMode (Can_17_McmCanConf_CanController_CanController_1,CAN_T_START);

/* Data transmission by Controller 0 to 1 */
Can_17_McmCan_Write(8, &PduInfo_1[0]);

/* In Scheduled function call poll for the reception of the message */
/* Reception is polled for and shall raise Can If notification in controller 1 */
Can_17_McmCan_MainFunction_Read_x();

/* Transmission is polled for and shall raise a Can If notification in controller 0 */
Can_17_McmCan_MainFunction_Write_x();

```

### Possible values of CanControllerBaseAddress container

**Table 5**                      **Controller base address List**

Sl. No.	Controller	Base address
1	Controller 0 (Node 00)	0xF0208100
2	Controller 1 (Node 01)	0xF0208500
3	Controller 2 (Node02)	0xF0208900
4	Controller 3 (Node03)	0xF0208D00
5	Controller 4 (Node10)	0xF0218100
6	Controller 5 (Node11)	0xF0218500
7	Controller 6 (Node12)	0xF0218900
8	Controller 7 (Node 13)	0xF0218D00
9	Controller 8 ( Node20)	0xF0228100
10	Controller 9 (Node 21)	0xF0228500
11	Controller 10 (Node 22)	0xF0228900
12	Controller 11 (Node 23)	0xF0228D00
13	Controller 12 (Node 30)	0xF0238100
14	Controller 13 (Node 31)	0xF0238500

## 1 Can\_17\_McmCan driver

**Table 5 Controller base address List (continued)**

Sl. No.	Controller	Base address
15	Controller 14 (Node 32)	0xF0238900
16	Controller 15 (Node 33)	0xF0238D00
17	Controller 16 (Node 40)	0xF0348100
18	Controller 17 (Node 41)	0xF0348500
19	Controller 18 (Node 42)	0xF0348900
20	Controller 19 (Node 43)	0xF0348D00

Above list contains the base address of the controller nodes supported, these address are to be updated by the integrator in the respective CanController configuration for mapping the controller to respective CAN hardware object (refer to CanControllerBaseAddress in the CanController container).

### 1.1.5 Key architectural considerations

#### 1.1.5.1 CAN interrupt handling

##### Tx event handling

TEFN (Tx Event FIFO New Entry) is the only event enabled for handling the Tx event FIFO.

For every element added in the event FIFO, this event will be generated. TEFL (Tx Event FIFO Lost) and TEFF (Tx Event FIFO Full) events are cleared in the same handler. If TEFL is SET, this indicates that the Tx event is lost. In this case the CAN driver will raise an error as CAN\_17\_MCMCAN\_E\_DATA\_LOST. The same error is raised during multi-period transmit in Can\_17\_McmCan\_MainFunction\_Write\_x. This indicates that the bus is loaded, and hence, no sufficient time is provided to process the Tx notifications to upper layer.

##### Rx dedicated handling

DRX (Message stored to Dedicated Rx Buffer) is the event raised when one of the dedicated buffer is updated with the message from CAN bus. Corresponding independent dedicated buffer bits in NDAT1 and NDAT2 will be SET if message is copied.

##### Rx FIFO handling

RFxW (Rx FIFO x Watermark reached) and RFxF (Rx FIFO x Full) are the two events that are enabled for handling the Rx FIFO (x represents FIFO 0 or FIFO 1).

Watermark is used for CAN HW to trigger the interrupt when certain number of messages are received in FIFO. If RFxL is SET, this indicates that the FIFO message is lost for which CAN driver will raise the error as CAN\_17\_MCMCAN\_E\_DATA\_LOST. Also RFxL is cleared by CAN driver. This indicates that the bus is loaded and no sufficient time is provided to process the received frames.

On watermark interrupt, handler processes maximum of configured FIFO elements. If messages are received while the Rx FIFO messages are being processed; and; if number of messages received is greater than the configured threshold level on exit of interrupt handler, watermark interrupt will not be triggered. Hence all messages will be processed only on FULL interrupt.

##### Bus Off handling

Bus off interrupt is enabled in order to indicate that the bus is faulty to notify upper layer for handling the erroneous bus. After a bus off occurred, further Can\_Write requests should be only issued after a successful transition to STARTED state.

*Note: TEFN, RF0W, RF1W and DRX bits have the RWH attribute. As there is a possibility of hardware updating the TEFN, RF0W, RF1W and DRX bits in background in same cycle when software is trying to clear this bit, IR remains updated due to hardware write. For this software has to clear the flag repeatedly to ensure that the intended flag*

## 1 Can\_17\_McmCan driver

*is cleared before processing the interrupt. So all the above listed flags are cleared in a loop with an exit condition for maximum of three retries. Note that retry mechanism is not implemented for Busoff interrupt since the bit setting and clearing from software cannot occur in same clock cycle.*

### 1.1.5.2 Multi-period Tx and Rx

- The multi-period Tx and Rx main function calls Can\_17\_McmCan\_MainFunction\_Read\_(x) and Can\_17\_McmCan\_MainFunction\_Write\_(x), where number of main function calls generated is based on the number of main function period entries configured in Can/CanGeneral/CanMainFunctionRWPeriods configured are generated with the suffix 'x' changing based on the index of Can/CanGeneral/CanMainFunctionRWPeriods/\*[] configured
- The multi-period Tx and Rx will be available only when the number of Can/CanGeneral/CanMainFunctionRWPeriods configured is greater than one and at least one controller is configured with Rx (for Can\_17\_McmCan\_MainFunction\_Read\_(x)) or Tx (for Can\_17\_McmCan\_MainFunction\_Write\_(x)) in polling mode or in mixed mode
- The default function call Can\_17\_McmCan\_MainFunction\_Read will not be available when Can\_17\_McmCan\_MainFunction\_Read\_(x) is generated
- The default function call Can\_17\_McmCan\_MainFunction\_Write will not be available when Can\_17\_McmCan\_MainFunction\_Write\_(x) is generated
- If at least one controller is configured to have Tx as polling mode or mixed mode and CanMainFunctionPeriod is greater than one, then the function Can\_17\_McmCan\_MainFunction\_Write\_(x) is generated for all values of 'x' available in the index of CanMainFunctionPeriod, even if no controller Tx operating is polling mode or mixed mode is referring to that CanMainFunctionPeriod index, this function generated for such CanMainFunctionPeriod is effectively an empty function with no actions performed
- If at least one controller is configured to have Rx as polling mode or mixed mode and CanMainFunctionPeriod is greater than one, then the function Can\_17\_McmCan\_MainFunction\_Read\_(x) is generated for all values of 'x' available in the index of CanMainFunctionPeriod, even if no controller Rx operating is polling mode or mixed mode is referring to that CanMainFunctionPeriod index, this function generated for such CanMainFunctionPeriod is effectively an empty function with no actions performed
- The multi-period Tx and Rx functions generated for a CanMainFunctionPeriod will give out notifications only for hardware object handle events (Tx / Rx) associated to that CanMainFunctionPeriod

### 1.1.5.3 Mixed Mode Rx/Tx Processing

In case a controller's Rx/Tx processing is selected as MIXED, the hardware objects associated with that particular controller can be configured to be processed via INTERRUPT or POLLING method.

#### Mixed mode for Rx processing:

Rx FIFO0/1 or dedicated objects can be configured to INTERRUPT or POLLING, if the Rx processing is configured as MIXED.

In a controller configured as MIXED Rx processing, if some of the hardware objects are selected as INTERRUPT and some as POLLING, all dedicated hardware objects would still receive an interrupt. This is because the interrupt lines (DRX bit) are shared in case of dedicated. However, only those hardware objects configured as INTERRUPT would generate a notification. For the notification of hardware objects configured as POLLING Can\_17\_McmCan\_MainFunction\_Read should be called.

#### Mixed mode for Tx processing:

Tx queue or dedicated objects can be configured to INTERRUPT or POLLING for a controller configured in MIXED mode TX processing.

Even if some of the hardware objects are selected as INTERRUPT and some as POLLING, all hardware objects would still receive an interrupt. This is because, TEFN is common for all hardware objects in a controller. However, only those hardware objects configured as INTERRUPT would generate a notification.

---

**1 Can\_17\_McmCan driver**

For the notification of hardware objects configured as POLLING Can\_17\_McmCan\_MainFunction\_Write should be called. Note that the Tx slots are released only after providing respective notifications.

**1.1.5.4 L-PDU Callout**

The AUTOSAR CAN module supports optional L-PDU callouts on every reception of L-PDU.

Can\_17\_McmCan\_PBCfg.c will contain the prototype of the L-PDU callout. Since the name of the callout function is provided through configuration, it cannot be in static file.

In case of ICom, the return value of the callout is not checked. This is because in case callout function returns false, RxIndication would not get triggered.

L-PDU Callout will only be invoked when the controller is in STARTED state and no callout will be provided when the device is in any other states.

---

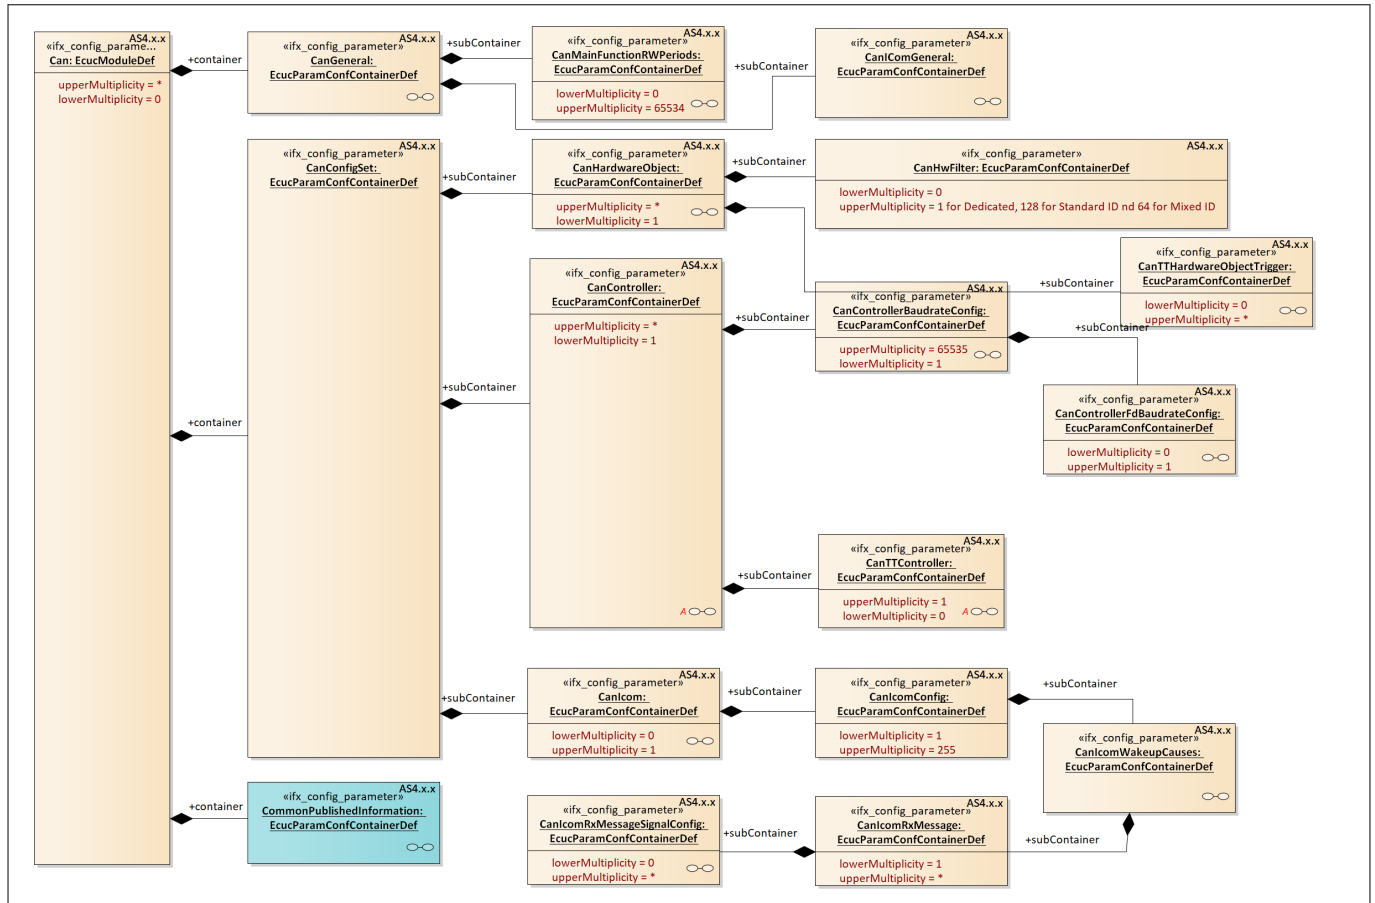

**1 Can\_17\_McmCan driver****1.2 Assumptions of Use (AoU)**

There are no Assumptions of Use (AoU)s for the CAN driver.

## 1 Can\_17\_McmCan driver

### 1.3 Reference information

#### 1.3.1 Configuration interfaces

**Figure 4** Container hierarchy along with their configuration parameters

##### 1.3.1.1 Container: CanConfigSet

The container contains the configuration parameters and sub containers of the AUTOSAR CAN driver.

Post-Build Variant Multiplicity: -

Multiplicity Configuration Class: -

##### 1.3.1.2 Container: CanController

The container contains the configuration parameters of the CAN controller(s).

The upper multiplicity of this container depends on the number of CAN controllers configured. This number cannot exceed the total number of CAN controllers present in a device.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.3 Container: CanControllerBaudrateConfig

The container contains bit timing related configuration parameters of the CAN controller(s).

The multiplicity of the container is from 1 to 65535. The range is limited as the MCMCAN hardware supports only baud rates from 40 to 100 kbps.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

#### 1.3.1.3.1 CanControllerBaudRate

**Table 22 Specification for CanControllerBaudRate**

<b>Name</b>	CanControllerBaudRate		
<b>Description</b>	<p>Specifies the baudrate of the controller (in Kbps).</p> <p>It is dependent on values of CanControllerActivation, CanPeripheralBusClockRef, CanControllerPropSeg, CanControllerSeg1, CanControllerSeg2 and CanControllerSyncJumpWidth. In case the user does not configure the mentioned parameters within their prescribed ranges, a generation error would be reported.</p> <p>The range is limited from 40 to 1000 kbps as the MCMCAN driver hardware supports only this range of baud rate accurately.</p> <p>The default value is set to 500 kbps, as it is the most commonly used baud rate.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	40 - 1000		
<b>Default value</b>	500		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-

## 1 Can\_17\_McmCan driver

### 1.3.1.4.11 CanControllerTxBitRateSwitch

**Table 41** Specification for CanControllerTxBitRateSwitch

<b>Name</b>	CanControllerTxBitRateSwitch		
<b>Description</b>	<p>Specifies if the bit rate switching shall be used for transmissions</p> <p>If FALSE, the CAN FD frames shall be sent without bit rate switching.</p> <p>The default value of the CanControllerTxBitRateSwitch configuration parameter is set to TRUE. CAN FD being used without bitrate switch enabled is a special case.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucBooleanParamDef
<b>Range</b>	TRUE FALSE		
<b>Default value</b>	TRUE		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanControllerActivation		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.5 Container: CanHwFilter

This container is only valid for HRHs and contains the configuration (parameters) of one hardware filter.

Multiplicity of container varies based on the type of object. In case the receive object type is dedicated, user can configure single filter which means message-id matching the value in CanHwFilterCode will only be received by hardware. CanHwFilterMask cannot be configured. In case of receive FIFO for which the CanHwObjectCount is greater than 1 multiple filter ranges can be defined and CanHwFilterMask will be enabled to define the mask to accept range of message-ids. In case only standard ids are configured, multiplicity is 128 elements, extended id, multiplicity is 64 and mixed is 64 elements. Note that if the CanIdType is configured as MIXED, a filter slot in standard ID and Extended ID will be utilized to support both 11-bit and 29-bit message-ids.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

#### 1.3.1.5.1 CanHwFilterCode

**Table 42** Specification for CanHwFilterCode

<b>Name</b>	CanHwFilterCode
<b>Description</b>	<p>Specifies (together with the filter mask) the identifiers range that passes the hardware filter.</p> <p>The referenced hardware object with CanObjectType as RECEIVE type.</p> <p>The default value is set to 2047 as this will match all the standard ID type 11-bit identifiers.</p>

**1 Can\_17\_McmCan driver**
**Table 42 Specification for CanHwFilterCode (continued)**

<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 4294967295		
<b>Default value</b>	2047		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanIdType, CanObjectType		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.5.2 CanHwFilterMask**
**Table 43 Specification for CanHwFilterMask**

<b>Name</b>	CanHwFilterMask		
<b>Description</b>	<p>Describes a mask for the hardware-based filtering of CAN identifiers. The CAN identifiers of the incoming messages are masked with the appropriate CanFilterMask bits holding a 0, which means do not care, that is, do not compare the message identifier in the respective bit position.</p> <p>The mask should be built by filling with leading 0. In case of CanIdType EXTENDED or MIXED, a 29-bit mask should be built. In case of CanIdType STANDARD, an 11-bit mask should be built</p> <p>The default value is set to 2047 as this will mask all the standard ID type 11-bit identifiers. This is because for STANDARD ID it acts as an open filter, but for extended IDs it is not an open filter</p> <p><i>Note: The CanHwFilterMask value shall be applicable only in the case of an Rx FIFO being used (i.e. CanHwObjectCount value greater than 1), in the case of dedicated Rx filter (i.e. CanHwObjectCount value equal to 1) range filtering is not applicable and will be set to non-editable.</i></p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 4294967295		
<b>Default value</b>	2047		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanHwObjectCount, CanObjectType, CanIdType		

## 1 Can\_17\_McmCan driver

<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.
------------------------	--

### 1.3.1.6      **Container: CanIcom**

This container contains the parameters for configuring pretended networking. The lower multiplicity of the container is 0 and upper multiplicity is 1.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

### 1.3.1.7      **Container: CanIcomConfig**

This container contains the configuration parameters of the ICOM configuration.

It is enabled only when CanPublicIcomSupport is enabled

The upper multiplicity of the CanIcomconfig configuration parameter is limited to 255 as this is the maximum ICOM configurations supported by the CAN driver.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

#### 1.3.1.7.1      **CanIcomConfigId**

**Table 44**      **Specification for CanIcomConfigId**

<b>Name</b>	CanIcomConfigId		
<b>Description</b>	Identifies the ID of the ICOM configuration. The default value is set to 1 as it is the start value of the config ID value.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	1 - 255		
<b>Default value</b>	1		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

#### 1.3.1.7.2      **CanIcomWakeOnBusOff**

**Table 45**      **Specification for CanIcomWakeOnBusOff**

<b>Name</b>	CanIcomWakeOnBusOff
-------------	---------------------

## 1 Can\_17\_McmCan driver

**Table 45 Specification for CanIcomWakeOnBusOff (continued)**

<b>Description</b>	<p>Defines that the MCU should wake if the bus-off is detected or not.</p> <p>The default value is set to TRUE as bus-off error detection is commonly enabled in the communication systems.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucBooleanParamDef
<b>Range</b>	<p>TRUE</p> <p>FALSE</p>		
<b>Default value</b>	TRUE		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.8 Container: CanIcomGeneral

This container contains the general configuration parameters of the ICOM configuration. the both the lower multiplicity of this container is 0 and upper multiplicity is 1.

Post-Build Variant Multiplicity: -

Multiplicity Configuration Class: -

#### 1.3.1.8.1 CanIcomLevel

**Table 46 Specification for CanIcomLevel**

<b>Name</b>	CanIcomLevel		
<b>Description</b>	<p>Defines the level of the pretended networking.</p> <p>The default value is set to CAN_ICOM_LEVEL_ONE as the CAN driver supports only this level of pretended networking.</p> <p>The CanIcomLevel configuration parameter is made non-editable as the CAN driver only supports one ICOM-level type.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	<p>CAN_ICOM_LEVEL_ONE: The first level of pretended networking is supported</p> <p>CAN_ICOM_LEVEL_TWO: The second level of pretended networking is supported</p>		
<b>Default value</b>	CAN_ICOM_LEVEL_ONE		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-

## 1 Can\_17\_McmCan driver

**Table 46 Specification for CanIcomLevel (continued)**

### 1.3.1.8.2 CanIcomVariant

**Table 47 Specification for CanIcomVariant**

<b>Name</b>	CanIcomVariant		
<b>Description</b>	<p>Defines the variant, which is supported by this CanController.</p> <p>The default value is set to CAN_ICOM_VARIANT_SW as the CAN driver supports only software variant of ICOM.</p> <p>The CanIcomVariant configuration parameter is made non-editable as the CAN driver does not support variants of ICOM other than the default type mentioned.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	<p>CAN_ICOM_VARIANT_HW: Pretended networking is supported only by hardware</p> <p>CAN_ICOM_VARIANT_NONE: Pretended networking is not supported</p> <p>CAN_ICOM_VARIANT_SW: Pretended networking is supported only by software</p>		
<b>Default value</b>	CAN_ICOM_VARIANT_SW		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.9 Container: CanIcomRxMessage

This container contains the configuration parameters for the wakeup causes for matching the received messages. It has to be configured as often as received messages are defined as wakeup cause.

Constraint: For all CanIcomRxMessage instances, the message IDs which are defined in CanIcomMessageId and in CanIcomMessageIdMask should not overlap.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

## 1 Can\_17\_McmCan driver

### 1.3.1.9.1 CanIcomCounterValue

**Table 48 Specification for CanIcomCounterValue**

<b>Name</b>	CanIcomCounterValue		
<b>Description</b>	<p>Defines that the MCU should wake when the message with the ID is received 'n' times on the communication channel.</p> <p>The default value is set to 1 as this is the minimum value for this parameter.</p>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	1 - 65536		
<b>Default value</b>	1		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.9.2 CanIcomMessageId

**Table 49 Specification for CanIcomMessageId**

<b>Name</b>	CanIcomMessageId		
<b>Description</b>	<p>Defines the message ID for which the wakeup causes of this CanIcomRxMessage are configured for. In addition a mask (CanIcomMessageIdMask) can be defined, in that case it is possible to define a range of Rx messages, which can create a wakeup condition.</p> <p>The default value is set to 1 as this is the minimum value for the configuration parameter.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 536870912		
<b>Default value</b>	0		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

## 1 Can\_17\_McmCan driver

### 1.3.1.9.3 CanIcomMessageIdMask

**Table 50 Specification for CanIcomMessageIdMask**

<b>Name</b>	CanIcomMessageIdMask		
<b>Description</b>	<p>Describes a mask for filtering the CAN identifiers. The CAN identifiers of incoming messages are masked with CanIcomMessageIdMask. If the masked identifier matches the masked value of CanIcomMessageId, it can create a wakeup condition for CanIcomRxMessage. Bits holding a 0 signifies do not care, that is, do not compare the message identifier in the respective bit position.</p> <p>The default value is set to 1 as this is the minimum value for the configuration parameter.</p>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 536870912		
<b>Default value</b>	0		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.9.4 CanIcomMissingMessageTimerValue

**Table 51 Specification for CanIcomMissingMessageTimerValue**

<b>Name</b>	CanIcomMissingMessageTimerValue		
<b>Description</b>	<p>Defines that the MCU should wake when the message with the configured ICOM Message ID is not received for a specific time in seconds on the communication channel.</p> <p>This parameter would be disabled for editing as MCMCAN does not support wakeup over CAN bus.</p> <p>The configuration parameter value range is limited from 1 ms to 65.535 s as per the timer ability of the micro-controller.</p> <p>The default value is set to 1 s to comply with common timer settings.</p>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucFloatParamDef
<b>Range</b>	0.000001 - 65.535		
<b>Default value</b>	1.0		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile

<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.10 Container: CanIcomRxMessageSignalConfig

This container contains the configuration parameters for the wakeup causes for the matching signals.

It has to be configured as often as a signal is defined as wakeup cause. When at least one Signal conditions defined in CanIcomRxMessageSignalConfig evaluates to TRUE or when no CanIcomRxMessageSignalConfig is defined, the whole wakeup condition is considered to be TRUE. All instances of this container refer to the same frame/PDU (see CanIcomMessageId). the lower multiplicity of the container is 0 and upper multiplicity is \*.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

#### 1.3.1.10.1 CanIcomSignalMask

**Table 54 Specification for CanIcomSignalMask**

<b>Name</b>	CanIcomSignalMask		
<b>Description</b>	<p>This parameter should be used to mask a signal in the payload of a CAN message.</p> <p>The mask is binary AND with the signal payload. The result will be used in combination of the operations defined in CanIcomSignalOperation with the CanIcomSignalValue.</p> <p>The configuration parameter is non-editable as the mask value is taken from the CanIcomSignalMaskUpper32bits and CanIcomSignalMaskLower32bits container, the following split of the CanIcomSignalMask configuration parameter is due to the limitation of configuration tool to support the full range of this parameter.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 9223372036854775807		
<b>Default value</b>	0		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanIcomMessageIdMask, CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

## 1 Can\_17\_McmCan driver

### 1.3.1.10.2 CanIcomSignalMaskLower32bits

**Table 55**      **Specification for CanIcomSignalMaskLower32bits**

<b>Name</b>	CanIcomSignalMaskLower32bits		
<b>Description</b>	<p>Defines the lower 32 bit value of the parameter, which is used to mask a signal in the payload of a CAN message.</p> <p>The default value is set to the maximum range to accept all the messages.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 4294967295		
<b>Default value</b>	4294967295		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanIcomMessageIdMask, CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.10.3 CanIcomSignalMaskUpper32bits

**Table 56**      **Specification for CanIcomSignalMaskUpper32bits**

<b>Name</b>	CanIcomSignalMaskUpper32bits		
<b>Description</b>	<p>Defines the upper32 bit value of parameter, which is used to mask a signal in the payload of a CAN message.</p> <p>The default value is set to the maximum range to accept all the messages.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 4294967295		
<b>Default value</b>	4294967295		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanIcomMessageIdMask, CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

## 1 Can\_17\_McmCan driver

### 1.3.1.10.4 CanIcomSignalOperation

**Table 57 Specification for CanIcomSignalOperation**

<b>Name</b>	CanIcomSignalOperation		
<b>Description</b>	<p>Defines the operation, which should be used to verify whether the signal value creates a wakeup condition or not.</p> <p>The default value is set to the most commonly used one-on-one message mapping of the EQUAL operation.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	<p>AND: The received signal value masked by CanIcomSignalMask has at least one bit set in common with CanIcomSignalValue (binary AND).</p> <p>EQUAL: the received signal value masked by CanIcomSignalMask is equal to CanIcomSignalValue.</p> <p>GREATER: the received signal value masked by CanIcomSignalMask is strictly greater than CanIcomSignalValue.</p> <p>Values are interpreted as unsigned integers.</p> <p>SMALLER: the received signal value masked by CanIcomSignalMask is strictly smaller than CanIcomSignalValue.</p> <p>Values are interpreted as unsigned integers.</p> <p>XOR: the received signal value masked by CanIcomSignalMask then XORed to CanIcomSignalValue is not null.</p>		
<b>Default value</b>	EQUAL		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	CanIcomMessageIdMask, CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.10.5 CanIcomSignalRef

**Table 58 Specification for CanIcomSignalRef**

<b>Name</b>	CanIcomSignalRef		
<b>Description</b>	<p>References to the COM layer signal that ICOM should use as a reference parameter.</p> <p>The CanIcomSignalRef configuration parameter is made non-editable as the McmCan driver does not support matching of the ICOM message with the messages in the upper layer.</p> <p>To comply with the AUTOSAR schema this configuration parameter is added but not used in the generator files.</p>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucReferenceDef

## 1 Can\_17\_McmCan driver

**Table 58 Specification for CanIcomSignalRef (continued)**

<b>Range</b>	Reference to Node:		
<b>Default value</b>	NULL		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	CanIcomMessageIdMask		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.10.6 CanIcomSignalValue

**Table 59 Specification for CanIcomSignalValue**

<b>Name</b>	CanIcomSignalValue		
<b>Description</b>	<p>This parameter should be used to define a signal value, which shall be compared (CanIcomSignalOperation) with the masked CanIcomSignalMask value of the received signal (CanIcomSignalRef).</p> <p>The configuration parameter is non-editable as the value is taken from CanIcomSignalValueUpper32bits and CanIcomSignalValueLower32bits container, the following split of the CanIcomSignalValue configuration parameter is due to the limitation of configuration tool to support the full range of this parameter.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 9223372036854775807		
<b>Default value</b>	0		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanIcomMessageIdMask, CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.10.7 CanIcomSignalValueLower32bits

**Table 60 Specification for CanIcomSignalValueLower32bits**

<b>Name</b>	CanIcomSignalValueLower32bits
-------------	-------------------------------

**1 Can\_17\_McmCan driver**
**Table 60 Specification for CanIcomSignalValueLower32bits (continued)**

<b>Description</b>	Defines the lower 32 bit value of the parameter which is used to compare (CanIcomSignalOperation) with the masked CanIcomSignalMask value of the received signal (CanIcomSignalRef).  The default value is set to the maximum range to accept all the messages.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 4294967295		
<b>Default value</b>	4294967295

<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanIcomMessageIdMask, CanPublicIcomSupport		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.11 Container: CanIcomWakeupCauses**

This container contains the configuration parameters of the wakeup causes to leave the power saving mode.

## 1 Can\_17\_McmCan driver

Post-Build Variant Multiplicity: -

Multiplicity Configuration Class: -

### 1.3.1.12 Container: CanTTController

This container contains the configuration parameters of the TTCAN controller(s) (which are needed in addition to the configuration parameters of the CAN controller(s)) to support the TTCAN feature.

The TTCAN is not supported by the CAN driver and, therefore, the set of configurations related to TTCAN are made non-editable and not used in the generator files. The TTCAN-related configurations are kept for following the AUTOSAR schema.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

#### 1.3.1.12.1 CanTTControllerApplWatchdogLimit

**Table 62** Specification for CanTTControllerApplWatchdogLimit

<b>Name</b>	CanTTControllerApplWatchdogLimit		
<b>Description</b>	<p>Defines the maximum time period (unit is 256 times NTU) after which the application has to serve the watchdog.</p> <p>The TTCAN is not supported by the CAN driver and, therefore, the set of configurations related to the TTCAN are made non-editable and not used in the generator files. The TTCAN related configurations are kept for following the AUTOSAR schema.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 255		
<b>Default value</b>	0		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

#### 1.3.1.12.2 CanTTControllerCycleCountMax

**Table 63** Specification for CanTTControllerCycleCountMax

<b>Name</b>	CanTTControllerCycleCountMax
<b>Description</b>	<p>Defines the value for cycle_count_max.</p> <p>Allowed values:</p> <p>0x00: 1 basic cycle</p> <p>0x01: 2 basic cycles</p>

**1 Can\_17\_McmCan driver**
**Table 63 Specification for CanTTControllerCycleCountMax (continued)**

	0x03: 4 basic cycles 0x07: 8 basic cycles 0x0F: 16 basic cycles 0x1F: 32 basic cycles 0x3F: 64 basic cycles  The TTCAN is not supported by the CAN driver module and, therefore, the set of configurations related to TTCAN are made non-editable and not used in the generator files. The TTCAN related configurations are kept for following the AUTOSAR schema.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 63		
<b>Default value</b>	0		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU

## 1 Can\_17\_McmCan driver

### 1.3.1.13 Container: CanTTHardwareObjectTrigger

This container contains the configuration (parameters) of TTCAN triggers for hardware objects, which are additional to the configuration (parameters) of the CAN hardware objects.

The TTCAN is not supported by the CAN driver and, therefore, the set of configurations related to TTCAN are made non-editable and not used in the generator files. The TTCAN related configurations are kept for following the AUTOSAR schema.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

#### 1.3.1.13.1 CanTTHardwareObjectBaseCycle

**Table 81 Specification for CanTTHardwareObjectBaseCycle**

<b>Name</b>	CanTTHardwareObjectBaseCycle		
<b>Description</b>	<p>Defines the cycle_offset.</p> <p>CanTTHardwareObjectBaseCycle must be not greater than cycle_count_max.</p> <p>The TTCAN is not supported by the CAN driver and, therefore, the set of configurations related to TTCAN are made non-editable and not used in the generator files. The TTCAN related configurations are kept for following the AUTOSAR schema.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 63		
<b>Default value</b>	0		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

#### 1.3.1.13.2 CanTTHardwareObjectCycleRepetition

**Table 82 Specification for CanTTHardwareObjectCycleRepetition**

<b>Name</b>	CanTTHardwareObjectCycleRepetition		
<b>Description</b>	<p>Defines the repeat_factor.</p> <p>CanTTHardwareObjectCycleRepetition should be a power of two (2), greater than cycle_offset but not greater than cycle_count_max + 1.</p> <p>The TTCAN is not supported by the CAN driver and, therefore, the set of configurations related to TTCAN are made non-editable and not used in the generator files. The TTCAN related configurations are kept for following the AUTOSAR schema.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef

**1 Can\_17\_McmCan driver**

### 1.3.1.14 Container: CommonPublishedInformation

General configuration of CAN driver common container, aggregated by all modules. It contains published information about vendor and versions.

Post-Build Variant Multiplicity: -

Multiplicity Configuration Class: -

#### 1.3.1.14.1 ArMajorVersion

**Table 86 Specification for ArMajorVersion**

<b>Name</b>	ArMajorVersion		
<b>Description</b>	This parameter provides the major version of the AUTOSAR specification. The default value is set to 4 as the CAN driver is following the AUTOSAR version 4.x.x.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 255		
<b>Default value</b>	4		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Published-Information	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

#### 1.3.1.14.2 ArMinorVersion

**Table 87 Specification for ArMinorVersion**

<b>Name</b>	ArMinorVersion		
<b>Description</b>	This parameter provides the minor version of the AUTOSAR specification.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 255		
<b>Default value</b>	As per AUTOSAR minor version		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-

## 1 Can\_17\_McmCan driver

**Table 87 Specification for ArMinorVersion (continued)**

<b>Value configuration class</b>	Published-Information	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.14.3 ArPatchVersion

**Table 88 Specification for ArPatchVersion**

<b>Name</b>	ArPatchVersion		
<b>Description</b>	This parameter provides the patch version of the AUTOSAR specification.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 255		
<b>Default value</b>	As per the AUTOSAR patch version		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Published-Information	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.14.4 ModuleId

**Table 89 Specification for ModuleId**

<b>Name</b>	ModuleId		
<b>Description</b>	This parameter provides the module Id. The default value is set to 80 as this is the module ID of the CAN driver.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 65535		
<b>Default value</b>	80		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Published-Information	<b>Multiplicity configuration class</b>	-

**1 Can\_17\_McmCan driver**
**Table 89 Specification for ModuleId (continued)**

<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.14.5 Release**
**Table 90 Specification for Release**

<b>Name</b>	Release		
<b>Description</b>	<p>This parameter indicates the TC3xx device derivative used for the implementation.</p> <p>The default value is derived from the property file and represents the hardware derivative of the micro controller for which the CAN driver is being configured.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucStringParamDef
<b>Range</b>	String		
<b>Default value</b>	As per the hardware derivative		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Published-Information	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.14.6 SwMajorVersion**
**Table 91 Specification for SwMajorVersion**

<b>Name</b>	SwMajorVersion		
<b>Description</b>	<p>This parameter provides the major version of the software.</p> <p>The default value is set to the software version that will be incremented per release of the code.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 255		
<b>Default value</b>	As per the software version		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Published-Information	<b>Multiplicity configuration class</b>	-

## 1 Can\_17\_McmCan driver

**Table 91 Specification for SwMajorVersion (continued)**

<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.14.7 SwMinorVersion

**Table 92 Specification for SwMinorVersion**

<b>Name</b>	SwMinorVersion		
<b>Description</b>	<p>This parameter provides the minor version of the software.</p> <p>The default value is set to the software version that will be incremented per update of the code.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 255		
<b>Default value</b>	As per the software version		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Published-Information	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.14.8 SwPatchVersion

**Table 93 Specification for SwPatchVersion**

<b>Name</b>	SwPatchVersion		
<b>Description</b>	<p>This parameter provides the patch version of the software.</p> <p>The default value is set to the software version that will be incremented per patch set of the code after release.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 255		
<b>Default value</b>	As per the software version		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Published-Information	<b>Multiplicity configuration class</b>	-

## 1 Can\_17\_McmCan driver

**Table 93 Specification for SwPatchVersion (continued)**

<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.14.9 VendorApiInfix

**Table 94 Specification for VendorApiInfix**

<b>Name</b>	VendorApiInfix		
<b>Description</b>	This parameter is used to specify the vendor specific name. The default value is set to McmCan as this is the unique name of the CAN driver provided by Infineon.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucStringParamDef
<b>Range</b>	String		
<b>Default value</b>	McmCan		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Published-Information	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.14.10 VendorId

**Table 95 Specification for VendorId**

<b>Name</b>	VendorId		
<b>Description</b>	This parameter provides the vendor Id The default value is set to 17 as this is the Infineon vendor ID.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 65535		
<b>Default value</b>	17		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Published-Information	<b>Multiplicity configuration class</b>	-

<b>Autosar Version</b>	Applicable for Autosar version 4.2.2.
------------------------	---------------------------------------

### 1.3.1.16.4 CanEcucPartitionRef

**Table 99 Specification for CanEcucPartitionRef**

<b>Name</b>	CanEcucPartitionRef		
<b>Description</b>	<p>The parameter maps the CAN driver to zero or multiple ECUC partitions to make the modules API available in this partition. The CAN driver will operate as an independent instance in each of the partitions.</p> <p><i>Note: Parameter support is added only for AUTOSAR schema compliance. This parameter is not used in code generation logic, hence this parameter is made editable false.</i></p>		
<b>Multiplicity</b>	0..*	<b>Type</b>	EcucReferenceDef
<b>Range</b>	Reference to Node:		
<b>Default value</b>	NULL		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar version 4.4.0.		

### 1.3.1.16.5 CanIndex

**Table 100 Specification for CanIndex**

<b>Name</b>	CanIndex		
<b>Description</b>	<p>Specifies the InstanceId of the module instance. If only one instance is present it shall have the Id 0.</p> <p>The default value is set as 0 assuming there is only one instance of the CAN driver.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 255		
<b>Default value</b>	0		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-

## 1 Can\_17\_McmCan driver

**Table 100 Specification for CanIndex (continued)**

<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.16.6 CanInitDeInitApiMode

**Table 101 Specification for CanInitDeInitApiMode**

<b>Name</b>	CanInitDeInitApiMode		
<b>Description</b>	<p>Defines the mode in which the Init and DeInit APIs will be used.</p> <p>The default value of this parameter is set to Supervisor to enable maximum access rights to the registers used by the CAN driver.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	CAN_17_MCMCAN_MCAL_SUPERVISOR: Operating mode used is Supervisory CAN_17_MCMCAN_MCAL_USER1: Operating mode used is USER-1		
<b>Default value</b>	CAN_17_MCMCAN_MCAL_SUPERVISOR		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.16.7 CanLPduReceiveCalloutFunction

**Table 102 Specification for CanLPduReceiveCalloutFunction**

<b>Name</b>	CanLPduReceiveCalloutFunction		
<b>Description</b>	<p>Specifies the name of a callout function that is called after a successful reception of a received CAN Rx L-PDU. If this parameter is configured with NULL_PTR, no callout will take place.</p> <p>The L-PDU callout function is mapped in a separate memory section.</p> <p>The L-PDU call out configuration parameter is set to non-editable as the CAN driver implemented is not an external CAN controller using any form of communication for interaction with the hardware.</p> <p>The default value is set to NULL_PTR as this configuration parameter is not being used.</p>		

## 1 Can\_17\_McmCan driver

**Table 102 Specification for CanLPduReceiveCalloutFunction (continued)**

<b>Multiplicity</b>	0..1	<b>Type</b>	EcucFunctionNameDef
<b>Range</b>	String		
<b>Default value</b>	NULL		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.16.8 CanMainFunctionBusoffPeriod

**Table 103 Specification for CanMainFunctionBusoffPeriod**

<b>Name</b>	CanMainFunctionBusoffPeriod		
<b>Description</b>	<p>Describes the period for cyclic call to Can_17_McmCan_MainFunction_Busoff. The unit is expressed in seconds.</p> <p>The default value is set to 5 ms. This is done to keep all the communication module main function periodicity to a common value.</p>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucFloatParamDef
<b>Range</b>	0.001 - 65.535		
<b>Default value</b>	0.005		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.16.9 CanMainFunctionModePeriod

**Table 104 Specification for CanMainFunctionModePeriod**

<b>Name</b>	CanMainFunctionModePeriod		
<b>Description</b>	Describes the period for the cyclic call to Can_17_McmCan_MainFunction_Mode. The unit is expressed in seconds.		

**1 Can\_17\_McmCan driver**
**Table 104 Specification for CanMainFunctionModePeriod (continued)**

	<p>The default value is set to 5 ms. This is done to keep all the communication module main function periodicity to a common value.</p> <p>The parameter is made non-editable as the CAN driver has a synchronous mode setting mechanism and does not support the Can_17_McmCan_MainFunction_Mode() function.</p> <p>The configuration parameter, even though not used, shall be present in the schema to maintain the AUTOSAR schema.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucFloatParamDef
<b>Range</b>	0.001 - 65.535		
<b>Default value</b>	0.005		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-

<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

## 1 Can\_17\_McmCan driver

### 1.3.1.16.18 CanTimeoutDuration

**Table 113 Specification for CanTimeoutDuration**

<b>Name</b>	CanTimeoutDuration		
<b>Description</b>	<p>Specifies the maximum time for the blocking function until a timeout is detected. The unit is expressed in seconds.</p> <p>The default value is set to 1ms for the CanTimeoutDuration configuration parameter considering that no hardware action should take more than 1ms to execute.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucFloatParamDef
<b>Range</b>	0.000001 - 65.535		
<b>Default value</b>	0.001		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.16.19 CanVersionInfoApi

**Table 114 Specification for CanVersionInfoApi**

<b>Name</b>	CanVersionInfoApi		
<b>Description</b>	<p>Switches the Can_17_McmCan_GetVersionInfo() API to ON or OFF.</p> <p>The default value is set as FALSE to reduce the code foot print as version information is seldom used in the development phase.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucBooleanParamDef
<b>Range</b>	TRUE FALSE		
<b>Default value</b>	FALSE		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

## 1 Can\_17\_McmCan driver

### 1.3.1.17 Container: CanMainFunctionRWPeriods

This container contains the parameter for configuring the period for the cyclic call to Can\_17\_McmCan\_MainFunction\_Read or Can\_17\_McmCan\_MainFunction\_Write depending on the referring item.

The multiplicity range of the CanMainFunctionRWPeriods configuration parameter has been altered to 254 to keep a controllable upper limit to the number of instances.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

#### 1.3.1.17.1 CanMainFunctionPeriod

**Table 115 Specification for CanMainFunctionPeriod**

<b>Name</b>	CanMainFunctionPeriod		
<b>Description</b>	<p>Describes the period for the cyclic call to Can_17_McmCan_MainFunction_Read or Can_17_McmCan_MainFunction_Write depending on the referring item. The unit is expressed in seconds. The different poll-cycles will be configurable when more than one CanMainFunctionPeriod is configured. In this case, multiple Can_17_McmCan_MainFunction_Read() or Can_17_McmCan_MainFunction_Write() will be provided by the CAN driver.</p> <p>The default value is set to 5 ms. This is done to keep all the communication module main function periodicity to a common value.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucFloatParamDef
<b>Range</b>	0.001 - 65.535		
<b>Default value</b>	0.005		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

#### 1.3.1.18 Container: CanHardwareObject

This container contains the configuration (parameters) of the CAN hardware objects. The lower multiplicity of the container is 1 and upper multiplicity id till the maximum number of hardware objects.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

## 1 Can\_17\_McmCan driver

### 1.3.1.18.1 CanControllerRef

**Table 116 Specification for CanControllerRef**

<b>Name</b>	CanControllerRef		
<b>Description</b>	Reference to the CAN controller to which the HOH (hardware object handle) is associated to		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucReferenceDef
<b>Range</b>	Reference to Node: CanController		
<b>Default value</b>	NULL		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.18.2 CanFdPaddingValue

**Table 117 Specification for CanFdPaddingValue**

<b>Name</b>	CanFdPaddingValue		
<b>Description</b>	<p>The parameter specifies the value which is used to pad unspecified data in the CAN FD frames greater than 8 bytes for transmission. This is necessary due to the discrete possible values of the DLC (data length count) if greater than 8 bytes.</p> <p>If the length of a PDU which was requested to be sent does not match the allowed DLC values, the remaining bytes up to the next possible value should be padded with this value.</p> <p>It is applicable only when CanObjectType is of transmit type and CAN FD is enabled.</p>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 255		
<b>Default value</b>	0		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	TRUE
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	Post-Build
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	CanControllerRef, CanControllerFdBaudrateConfig, CanObjectType		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

## 1 Can\_17\_McmCan driver

### 1.3.1.18.3 CanHandleType

**Table 118** Specification for CanHandleType

<b>Name</b>	CanHandleType		
<b>Description</b>	<p>Specifies the type (FULL-CAN or BASIC-CAN) of a hardware object.</p> <p>As FULL CAN feature is most commonly used, the default value of the CanHandleType configuration parameter is set to FULL.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	<p>BASIC: for several L-PDUs handled by the hardware object</p> <p>FULL: for only one L-PDU (identifier) handled by the hardware object</p>		
<b>Default value</b>	FULL		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.18.4 CanHardwareObjectUsesPolling

**Table 119** Specification for CanHardwareObjectUsesPolling

<b>Name</b>	CanHardwareObjectUsesPolling		
<b>Description</b>	<p>The parameter indicates that polling for a particular hardware object is enabled. This parameter is enabled if CanTxProcessing or CanRxProcessing is set to MIXED for the particular controller to which these hardware objects belong to. In this case, the hardware objects which have this parameter value set as TRUE will have the polling for that object enabled.</p> <p><i>Note: In case Rxprocessing or Txprocessing is configured as MIXED and if all hardware objects are configured to use polling or interrupt then a warning will be generated in configuration tool. Hence, in case the user wants to use only polling or only interrupt for the hardware objects associated with a certain controller, the user should select CanRxProcessing or CanTxProcessing as POLLING or INTERRUPT respectively.</i></p>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucBooleanParamDef
<b>Range</b>	<p>TRUE</p> <p>FALSE</p>		
<b>Default value</b>	FALSE		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-

**1 Can\_17\_McmCan driver**
**Table 119 Specification for CanHardwareObjectUsesPolling (continued)**

<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX FOR AS4.2.2 VARIANT AND AUTOSAR_ECUC FOR AS4.4.0 VARIANT	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanObjectType, CanTxProcessing, CanRxProcessing		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.18.5 CanHwFIFOThreshold**
**Table 120 Specification for CanHwFIFOThreshold**

<b>Name</b>	CanHwFIFOThreshold		
<b>Description</b>	<p>The parameter specifies the threshold size at which interrupt is triggered to copy the data</p> <p>CanHwFIFOThreshold should be less than or equal to CanFifoSize</p> <p>CanObjectType should be RECIEVE type and CanHwObjectCount should be greater than 1.</p> <p>The parameter specifies the threshold size at which interrupt is triggered to copy the data</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	1 - 64		
<b>Default value</b>	1		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	CanObjectType, CanHwObjectCount		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.18.6 CanHwObjectCount**
**Table 121 Specification for CanHwObjectCount**

<b>Name</b>	CanHwObjectCount		
<b>Description</b>	<p>Number of the hardware objects used to implement one HOH.</p> <p>In case of an HRH this parameter defines the number of elements in the hardware FIFO (for HRH objects the range is from 1 to 64).</p> <p>In case of a HTH it defines the number of elements in the Tx queue used for multiplexed transmission (for HTH objects the range is from 1 to 32).</p> <p>The maximum hardware object count is limited to 64 per controller. The limitation comes from the memory assigned per controller.</p>		

**1 Can\_17\_McmCan driver**
**Table 121 Specification for CanHwObjectCount (continued)**

<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	1 - 64

## 1 Can\_17\_McmCan driver

### 1.3.1.18.11 CanTriggerTransmitEnable

**Table 126** Specification for CanTriggerTransmitEnable

<b>Name</b>	CanTriggerTransmitEnable		
<b>Description</b>	Defines whether or not the CAN supports the trigger-transmit API for this handle. By default, the optional interface APIs are disabled to minimize the executable code size.		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucBooleanParamDef
<b>Range</b>	TRUE FALSE		
<b>Default value</b>	FALSE		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	CanObjectType		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

## 1.3.2 Functions - Type definitions

### 1.3.2.1 Can\_17\_McmCan\_LPduRxCalloutFnPtrType

**Table 127** Specification for Can\_17\_McmCan\_LPduRxCalloutFnPtrType

<b>Syntax</b>	Can_17_McmCan_LPduRxCalloutFnPtrType
<b>Type</b>	Pointer to a function of type boolean Function_Name ( const Can_HwHandleType Hrh, const Can_IdType CanId, const uint8 CanDataLength, const uint8 * const CanSduPtr )
<b>File</b>	Can_17_McmCan_PBcfg.c
<b>Description</b>	Pointer to the L-PDU Callout function
<b>Source</b>	AUTOSAR
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.

### 1.3.2.2 CanTrcv\_TrvcModeType

**Table 128** Specification for CanTrcv\_TrvcModeType

<b>Syntax</b>	CanTrcv_TrvcModeType
<b>Type</b>	Enumeration
<b>File</b>	Can_GeneralTypes.h

**1 Can\_17\_McmCan driver**
**Table 128 Specification for CanTrcv\_TrvcModeType (continued)**

<b>Range</b>	0 - CANTRCV_TRCVMODE_NORMAL	Transceiver mode Normal
	1 - CANTRCV_TRCVMODE_SLEEP	Transceiver mode Sleep
	2 - CANTRCV_TRCVMODE_STANDBY	Transceiver mode StandBy
<b>Description</b>	The data type defines the operating modes of the CAN transceiver driver.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1.3.2.3 CanTrcv\_TrvcWakeupModeType**
**Table 129 Specification for CanTrcv\_TrvcWakeupModeType**

<b>Syntax</b>	CanTrcv_TrvcWakeupModeType	
<b>Type</b>	Enumeration	
<b>File</b>	Can_GeneralTypes.h	
<b>Range</b>	0 - CANTRCV_WUMODE_ENABLE	The notification for wakeup events are enabled on the addressed transceiver.
	1 - CANTRCV_WUMODE_DISABLE	The notification for wakeup events are disabled on the addressed transceiver.
	2 - CANTRCV_WUMODE_CLEAR	The stored notification events are cleared on the addressed transceiver.
<b>Description</b>	The data type is used to control the CanTrcv concerning the wakeup events and wakeup notifications.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1.3.2.4 CanTrcv\_TrvcWakeupReasonType**
**Table 130 Specification for CanTrcv\_TrvcWakeupReasonType**

<b>Type</b>	Enumeration	
<b>File</b>	Can_GeneralTypes.h	
<b>Range</b>	0 - CANTRCV_WU_ERROR	Due to an error wake up reason is not detected. This value may only be reported when the error is reported to the DEM before.
	1 - CANTRCV_WU_NOT_SUPPORTED	The transceiver does not support any information for the wake up reason.
	2 - CANTRCV_WU_BY_BUS	The transceiver has detected that the network has caused the wake up of the ECU.

**1 Can\_17\_McmCan driver**
**Table 130 Specification for CanTrcv\_TrcevWakeupReasonType (continued)**

	3 - CANTRCV_WU_INTERNALLY	The transceiver has detected that the network has been woken up by the ECU through a request to the NORMAL mode.
	4 - CANTRCV_WU_RESET	The transceiver has detected, that the wakeup is due to an ECU reset.
	5 - CANTRCV_WU_POWER_ON	The transceiver has detected, that the wakeup is due to an ECU reset after power on.
	6 - CANTRCV_WU_BY_PIN	The transceiver has detected, that the wakeup is due to a state held at the pin.
	7 - CANTRCV_WU_BY_SYSERR	The transceiver has detected, that the wake up of the ECU was caused by a hardware related device failure.
<b>Description</b>	The data type denotes the wake up reason detected by the CanTrcv.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1.3.2.5 Can\_ControllerStateType**
**Table 131 Specification for Can\_ControllerStateType**

<b>Syntax</b>	Can_ControllerStateType	
<b>Type</b>	Enumeration	
<b>File</b>	Can_GeneralTypes.h	
<b>Range</b>	0 - CAN_CS_UNINIT	CAN controller state UNINIT.
	1 - CAN_CS_STARTED	CAN controller state STARTED.
	2 - CAN_CS_STOPPED	CAN controller state STOPPED.
	3 - CAN_CS_SLEEP	CAN controller state SLEEP.
<b>Description</b>	The data type represents the CAN controller state types as defined by the CAN controller state machine.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar version 4.4.0.	

**1.3.2.6 Can\_ErrorStateType**
**Table 132 Specification for Can\_ErrorStateType**

<b>Syntax</b>	Can_ErrorStateType	
<b>Type</b>	Enumeration	
<b>File</b>	Can_GeneralTypes.h	

## 1 Can\_17\_McmCan driver

**Table 132 Specification for Can\_ErrorStateType (continued)**

<b>Range</b>	0 - CAN_ERRORSTATE_ACTIVE	The CAN controller takes fully part in communication.
	1 - CAN_ERRORSTATE_PASSIVE	When in Passive does not send any frame, but controller can still receive packets.
	2 - CAN_ERRORSTATE_BUSOFF	The CAN controller does not take part in communication.
<b>Description</b>	The data type defines the error state of the CAN controller.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar version 4.4.0.	

### 1.3.2.7 Can\_HwHandleType

**Table 133 Specification for Can\_HwHandleType**

<b>Syntax</b>	Can_HwHandleType	
<b>Type</b>	uint16	
<b>File</b>	Can_GeneralTypes.h	
<b>Range</b>	0x00 - 0xFFFF	By default, extended type is defined
<b>Description</b>	The data type represents the hardware object handles of a CAN hardware unit. For CAN hardware units with more than 255 hardware objects, uses the extended range.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.2.8 Can\_HwType

**Table 134 Specification for Can\_HwType**

<b>Syntax</b>	Can_HwType	
<b>Type</b>	Structure	
<b>File</b>	Can_GeneralTypes.h	
<b>Range</b>	Can_IdType CanId	Standard/Extended CAN ID of CAN L-PDU
	Can_HwHandleType Hoh	ID of the corresponding Hardware Object Range
	uint8 ControllerId	ControllerId provided by CanIf clearly identify the corresponding controller
<b>Description</b>	The data type defines a data structure which clearly provides a hardware object handle including its corresponding CAN controller and therefore CanDrv as well as the specific CanId.	
<b>Source</b>	AUTOSAR	

## 1 Can\_17\_McmCan driver

**Table 134 Specification for Can\_HwType (continued)**

<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.
------------------------	--

### 1.3.2.9 Can\_PduType

**Table 135 Specification for Can\_PduType**

<b>Syntax</b>	Can_PduType	
<b>Type</b>	Structure	
<b>File</b>	Can_GeneralTypes.h	
<b>Range</b>	PduIdType swPduHandle	Software PDU handle
	uint8 length	Number of SDU data bytes
	Can_IdType id	Formatted CAN message identifier
	uint8 * sdu	Pointer to data bytes
<b>Description</b>	The data type unites PduId (swPduHandle), SduLength (length), SduData (sdu), and CanId (id) for any CAN L-SDU.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.2.10 Can\_IdType

**Table 136 Specification for Can\_IdType**

<b>Syntax</b>	Can_IdType	
<b>Type</b>	uint32	
<b>File</b>	Can_GeneralTypes.h	
<b>Range</b>	0x00- 0xDFFFFFFF	By default, extended 32-bit is defined
<b>Description</b>	<p>The data type represents the identifier of an L-PDU. The two most significant bits specify the frame type:</p> <ul style="list-style-type: none"> <li>00 CAN message with Standard CAN ID</li> <li>01 CAN FD frame with Standard CAN ID</li> <li>10 CAN message with Extended CAN ID</li> <li>11 CAN FD frame with Extended CAN ID</li> </ul> <p>The type can be either uint16 or uint32 (type can be uint16 when all HOH's are of STANDARD type otherwise the type should be uint32).</p> <p>The CAN driver should support both uint16 and uint32.</p> <p>Standard32Bit - 0 to 0x400007FF</p> <p>Standard16Bit - 0 to 0x47FF</p> <p>Extended32Bit - 0 to 0xDFFFFFFF</p>	
<b>Source</b>	AUTOSAR

### 1.3.2.11 Can\_StateTransitionType

**Table 137 Specification for Can\_StateTransitionType**

<b>Syntax</b>	Can_StateTransitionType	
<b>Type</b>	Enumeration	
<b>File</b>	Can_GeneralTypes.h	
<b>Range</b>	0 - CAN_T_START	CAN controller transition value to request state STARTED.
	1 - CAN_T_STOP	CAN controller transition value to request state STOPPED.
	2 - CAN_T_SLEEP	CAN controller transition value to request state SLEEP.
	3 - CAN_T_WAKEUP	CAN controller transition value to request state STOPPED from state SLEEP.
<b>Description</b>	The data type denotes the CAN controller state transitions.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar version 4.2.2.	

### 1.3.2.12 Can\_ReturnType

**Table 138 Specification for Can\_ReturnType**

<b>Syntax</b>	Can_ReturnType	
<b>Type</b>	Enumeration	
<b>File</b>	Can_GeneralTypes.h	
<b>Range</b>	0 - CAN_OK	Success
	1 - CAN_NOT_OK	Error or wakeup event occurred during sleep transition
	2 - CAN_BUSY	Transmit request could not be processed because no transmit object was available
<b>Description</b>	The data type represents the return values of the CAN driver APIs	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar version 4.2.2.	

## 1 Can\_17\_McmCan driver

### 1.3.2.13 Can\_17\_McmCan\_ConfigType

**Table 139 Specification for Can\_17\_McmCan\_ConfigType**

<b>Syntax</b>	Can_17_McmCan_ConfigType	
<b>Type</b>	Structure	
<b>File</b>	Can_17_McmCan.h	
<b>Range</b>	--	The elements of the data structure are specific to the micro-controller
<b>Description</b>	<p>The data type of the external data structure containing the overall initialization data for the CAN driver and SFR settings affecting all controllers. Furthermore it contains pointers to controller configuration structures.</p> <p>It contains the definition of the implementation-specific post build configuration structure of the CAN driver.</p>	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.2.14 Can\_17\_Mcmcan\_DrvStateMachine

**Table 140 Specification for Can\_17\_Mcmcan\_DrvStateMachine**

<b>Syntax</b>	Can_17_Mcmcan_DrvStateMachine	
<b>Type</b>	Enumeration	
<b>File</b>	Can_17_McmCan.h	
<b>Range</b>	0 - CAN_17_MCMCA_UNINIT	The driver state is UNINIT.
	1 - CAN_17_MCMCAN_READY	The driver state is READY
<b>Description</b>	The data type specifies the CAN driver state machine states.	
<b>Source</b>	IFX	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

## 1.3.3 Functions - APIs

This section lists all the APIs of the CAN driver.

### 1.3.3.1 Can\_17\_McmCan\_Init

**Table 141 Specification for Can\_17\_McmCan\_Init API**

<b>Syntax</b>	<pre>void Can_17_McmCan_Init (     const Can_17_McmCan_ConfigType * const Config )</pre>
<b>Service ID</b>	0x0
<b>Sync/Async</b>	Synchronous

**1 Can\_17\_McmCan driver**
**Table 141 Specification for Can\_17\_McmCan\_Init API (continued)**

<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Non Reentrant	
<b>Parameters (in)</b>	Config	Pointer to the CAN driver root configuration
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	void	-
<b>Description</b>	<p>The function initializes all global variables and relevant registers of the MCMCAN (based on configuration) assigned to that particular core with the values of structure referenced by the parameter Config. Successful execution of this API will trigger a state transition of the CAN Driver state machine from CAN_UNINIT to CAN_READY state.</p> <p>The controllers initialized shall be configured to reject reception of CAN frames with remote transmission requests (i.e. Frames with RTR bit set)</p> <p>This API must be invoked from all the cores using the CAN driver, as each call initializes only the SFRs and global variables of the CAN controllers used by the invoking core. The kernel clocks and common resource initialization are initialized by the MCALs master core.</p> <p>The CAN initialization status is set at the end of Initialization function execution.</p>	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	CAN_17_MCMCAN_E_MASTER_CORE_UNINIT, CAN_17_MCMCAN_E_NOT_CONFIGURED, CAN_17_MCMCAN_E_TRANSITION, CAN_17_MCMCAN_E_INIT_FAILED	
<b>Configuration dependencies</b>	-	
<b>User hints</b>	None	
<b>SFR accessed</b>	CAN_CLC(rw), CAN_MCR(rw), CAN_N_CCCR(rw), CAN_N_DBTP(w), CAN_N_GFC(ex_w), CAN_N_GRINT1(ex_w), CAN_N_GRINT2(ex_w), CAN_N_IR(w), CAN_N_NBTP(w), CAN_N_NPCR(ex_w), CAN_N_PSR(r), CAN_N_RX_BC(ex_w), CAN_N_RX_ESC(ex_w), CAN_N_RX_FOC(ex_w), CAN_N_RX_F1C(ex_w), CAN_N_SIDFC(ex_w), CAN_N_TDCR(w), CAN_N_TX_BC(w), CAN_N_TX_EFC(ex_w), CAN_N_TX_ESC(ex_w), CAN_N_XIDFC(ex_w), CPU_CORE_ID(r), SCU_CCUCON0(r), SCU_EICON0(rw), SCU_OSCCON(r), SCU_SYSPLLCON0(r), SCU_SYSPLLCON1(r), STM_TIM0(r)	
	<i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

## 1 Can\_17\_McmCan driver

### 1.3.3.2 Can\_17\_McmCan\_DeInit

**Table 142 Specification for Can\_17\_McmCan\_DeInit API**

<b>Syntax</b>	<pre>void Can_17_McmCan_DeInit (     void )</pre>	
<b>Service ID</b>	0x10	
<b>Sync/Async</b>	Synchronous	
<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Non Reentrant	
<b>Parameters (in)</b>	-	-
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	void	-
<b>Description</b>	<p>The function de-initializes all global variables and relevant registers of the MCMCAN (based on configuration) assigned to that particular core with the values of structure referenced by the parameter ConfigPtr. Successful execution of this API will trigger a state transition of the CAN Driver state machine from CAN_READY to CAN_UNINIT state.</p> <p>The Can_17_McmCan_DeInit() function is available only when CanDeInitApi is enabled. In case of AUTOSAR 4.2.2, the parameter can be enabled or disabled. In AUTOSAR 4.4.0 the parameter will always generate TRUE and will be disabled.</p>	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	CAN_17_MCMCAN_E_UNINIT, CAN_17_MCMCAN_E_SLAVE_CORE_INIT, CAN_17_MCMCAN_E_TRANSITION	
<b>Configuration dependencies</b>	CanDeInitApi	
<b>User hints</b>	None	
<b>SFR accessed</b>	CAN_CLC(rw), CAN_KRST0(rw), CAN_KRST1(rw), CAN_KRSTCLR(rw), CPU_CORE_ID(r), SCU_CCUCON0(r), SCU_EICON0(rw), SCU_OSCCON(r), SCU_SYSPLLCON0(r), SCU_SYSPLLCON1(r), STM_TIM0(r) <p><i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i></p>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

## 1 Can\_17\_McmCan driver

### 1.3.3.3 Can\_17\_McmCan\_SetControllerMode

**Table 143 Specification for Can\_17\_McmCan\_SetControllerMode API**

<b>Syntax</b>	<pre>Can_ReturnType Can_17_McmCan_SetControllerMode (     const uint8 Controller,     const Can_StateTransitionType Transition )</pre>	
<b>Service ID</b>	0x03	
<b>Sync/Async</b>	Synchronous	
<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Non Reentrant	
<b>Parameters (in)</b>	Controller Transition	CAN controller for which the controller mode status shall be changed Transition value to request new CAN controller state
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	Can_ReturnType	CAN_OK: Request accepted CAN_NOT_OK: Request not accepted, or, a development error
<b>Description</b>	<p>The function performs software triggered state transitions of the CAN controller state machine.</p> <p>The function is implemented synchronous as the change in the mode is done synchronously by the hardware. This is a deviation from AUTOSAR.</p> <p>Also there is no HW support to wakeup the controller, it is only logical sleep which is implemented in driver.</p>	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	CAN_17_MCMCAN_E_TRANSITION, CAN_17_MCMCAN_E_PARAM_CONTROLLER, CAN_17_MCMCAN_E_UNINIT, CAN_17_MCMCAN_E_NOT_CONFIGURED	
<b>Configuration dependencies</b>	-	
<b>User hints</b>	None	
<b>SFR accessed</b>	CAN_CLC(r), CAN_MCR(r), CAN_N_CCCR(rw), CAN_N_IE(w), CAN_N_IR(rw), CAN_N_NDAT1(rw), CAN_N_NDAT2(rw), CAN_N_PSR(r), CAN_N_RX_F0A(w), CAN_N_RX_F0S(r), CAN_N_RX_F1A(w), CAN_N_RX_F1S(r), CAN_N_TX_BCR(w), CAN_N_TX_BRP(r), CPU_CORE_ID(r), STM_TIM0(r) <i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar version 4.2.2.	

## 1 Can\_17\_McmCan driver

### 1.3.3.4 Can\_17\_McmCan\_SetControllerMode

**Table 144 Specification for Can\_17\_McmCan\_SetControllerMode API**

<b>Syntax</b>	<pre>Std_ReturnType Can_17_McmCan_SetControllerMode (     const uint8 Controller,     const Can_ControllerStateType Transition )</pre>	
<b>Service ID</b>	0x3	
<b>Sync/Async</b>	Synchronous	
<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Non Reentrant	
<b>Parameters (in)</b>	Controller Transition	CAN controller for which the controller mode status shall be changed Transition value to request new CAN controller state
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	Std_ReturnType	E_OK: Request accepted E_NOT_OK: Request not accepted, or, a development error occurred.
<b>Description</b>	<p>The function performs software triggered state transitions of the CAN controller State machine.</p> <p>The function is implemented synchronous as the change in the mode is done synchronously by the hardware. This is a deviation from AUTOSAR.</p> <p>Also there is no HW support to wakeup the controller, it is only logical sleep which is implemented in driver.</p>	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	CAN_17_MCMCAN_E_NOT_CONFIGURED, CAN_17_MCMCAN_E_UNINIT, CAN_17_MCMCAN_E_PARAM_CONTROLLER, CAN_17_MCMCAN_E_TRANSITION	
<b>Configuration dependencies</b>	-	
<b>User hints</b>	None	
<b>SFR accessed</b>	CAN_CLC(r), CAN_MCR(r), CAN_N_CCCR(rw), CAN_N_IE(w), CAN_N_IR(rw), CAN_N_NDAT1(rw), CAN_N_NDAT2(rw), CAN_N_PSR(r), CAN_N_RX_F0A(w), CAN_N_RX_F0S(r), CAN_N_RX_F1A(w), CAN_N_RX_F1S(r), CAN_N_TX_BCR(w), CAN_N_TX_BRP(r), CPU_CORE_ID(r), STM_TIM0(r) <i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar version 4.4.0.	

## 1 Can\_17\_McmCan driver

### 1.3.3.5 Can\_17\_McmCan\_SetBaudrate

**Table 145 Specification for Can\_17\_McmCan\_SetBaudrate API**

<b>Syntax</b>	Std_ReturnType Can_17_McmCan_SetBaudrate ( const uint8 Controller, const uint16 BaudRateConfigID )	
<b>Service ID</b>	0x0F	
<b>Sync/Async</b>	Synchronous	
<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Reentrant for different controllers. Non reentrant for the same controller.	
<b>Parameters (in)</b>	Controller BaudRateConfigID	CAN controller for which the, baud rate needs to be set Unique Id with a specific baud rate configuration
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	Std_ReturnType	E_OK: Service request accepted, setting of new baud rate started E_NOT_OK: Service request not accepted, or, development error reported.
<b>Description</b>	The function sets the baud rate configuration of the CAN controller during runtime when the CAN controller is in STOPPED state.  The Can_17_McmCan_SetBaudrate() function is available only when CanSetBaudrateApi is enabled.	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	CAN_17_MCMCAN_E_PARAM_CONTROLLER, CAN_17_MCMCAN_E_UNINIT, CAN_17_MCMCAN_E_PARAM_BAUDRATE, CAN_17_MCMCAN_E_NOT_CONFIGURED	
<b>Configuration dependencies</b>	CanSetBaudrateApi	
<b>User hints</b>	None	
<b>SFR accessed</b>	CAN_CLC(r), CAN_MCR(r), CAN_N_CCCR(rw), CAN_N_DBTP(w), CAN_N_NBTP(w), CAN_N_PSR(r), CAN_N_TDCR(w), CPU_CORE_ID(r), STM_TIM0(r)  <i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

## 1 Can\_17\_McmCan driver

### 1.3.3.6 Can\_17\_McmCan\_DisableControllerInterrupts

**Table 146 Specification for Can\_17\_McmCan\_DisableControllerInterrupts API**

<b>Syntax</b>	<pre>void Can_17_McmCan_DisableControllerInterrupts (     const uint8 Controller )</pre>	
<b>Service ID</b>	0x04	
<b>Sync/Async</b>	Synchronous	
<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Reentrant	
<b>Parameters (in)</b>	Controller	CAN controller for which interrupts need to be disabled
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	void	-
<b>Description</b>	The function disables all interrupts for the given CAN controller	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	CAN_17_MCMCAN_E_UNINIT, CAN_17_MCMCAN_E_NOT_CONFIGURED, CAN_17_MCMCAN_E_PARAM_CONTROLLER	
<b>Configuration dependencies</b>	-	
<b>User hints</b>	None	
<b>SFR accessed</b>	CAN_N_IE(rw), CPU_CORE_ID(r) <i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.3.7 Can\_17\_McmCan\_EnableControllerInterrupts

**Table 147 Specification for Can\_17\_McmCan\_EnableControllerInterrupts API**

<b>Syntax</b>	<pre>void Can_17_McmCan_EnableControllerInterrupts (     const uint8 Controller )</pre>	
<b>Service ID</b>	0x05	
<b>Sync/Async</b>	Synchronous	

## 1 Can\_17\_McmCan driver

**Table 147 Specification for Can\_17\_McmCan\_EnableControllerInterrupts API (continued)**

<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Reentrant	
<b>Parameters (in)</b>	Controller	CAN controller for which interrupts shall be re-enabled
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	void	-
<b>Description</b>	The functions re-enables the allowed interrupts of the given CAN controller	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	CAN_17_MCMCAN_E_PARAM_CONTROLLER, CAN_17_MCMCAN_E_UNINIT, CAN_17_MCMCAN_E_NOT_CONFIGURED	
<b>Configuration dependencies</b>	-	
<b>User hints</b>	None	
<b>SFR accessed</b>	CAN_N_IE(rw), CPU_CORE_ID(r) <i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.3.8 Can\_17\_McmCan\_SetIcomConfiguration

**Table 148 Specification for Can\_17\_McmCan\_SetIcomConfiguration API**

<b>Syntax</b>	<pre>Std_ReturnType Can_17_McmCan_SetIcomConfiguration (     const uint8 Controller,     const IcomConfigIdType ConfigurationId )</pre>	
<b>Service ID</b>	0x21	
<b>Sync/Async</b>	Asynchronous	
<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Reentrant for different Controllers. Non reentrant for the same Controller.	
<b>Parameters (in)</b>	Controller ConfigurationId	CAN controller for which the status shall be changed. Requested configuration. An ID greater than 0 identifies a configuration in which pretended networking is activated for the Controller. An ID value of 0

**1 Can\_17\_McmCan driver**
**Table 148 Specification for Can\_17\_McmCan\_SetIcomConfiguration API (continued)**

		deactivates the pretended networking identifier that is activated for the Controller.
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	Std_ReturnType	E_OK: CAN driver succeeded in setting a configuration with a valid Configuration id. E_NOT_OK: CAN driver failed to set a configuration with a valid Configuration id, or, development error occurred
<b>Description</b>	<p>The API should change the Icom configuration of a CAN controller to the requested one.</p> <p>The Can_17_McmCan_SetIcomConfiguration() function is available only when CanPublicIcomSupport is enabled.</p> <p><i>Note: For the API Can_SetIcomConfiguration, as per AUTOSAR 4.2.2 has a service ID 0xf which is also the service ID for Can_SetBaudRate.</i></p> <p><i>In AUTOSAR 4.4.0 the service ID correction for Can_SetIcomConfiguration was done and was modified to 0x21 so that it did not conflict with Can_SetBaudRate service ID (0xf).</i></p> <p><i>Hence the Can_SetIcomConfiguration shall have the service ID 0x21 in both AUTOSAR versions as per A2GT-PRQ-12538.</i></p>	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	CAN_17_MCMCAN_E_ICOM_CONFIG_INVALID, CAN_17_MCMCAN_E_PARAM_CONTROLLER, CAN_17_MCMCAN_E_UNINIT, CAN_17_MCMCAN_E_NOT_CONFIGURED	
<b>Configuration dependencies</b>	CanPublicIcomSupport	
<b>User hints</b>	None	
<b>SFR accessed</b>	CAN_CLC(r), CAN_MCR(r), CAN_N_CCCR(rw), CAN_N_IE(w), CAN_N_PSR(r), CPU_CORE_ID(r), STM_TIM0(r)  <i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1.3.3.9 Can\_17\_McmCan\_Write**
**Table 149 Specification for Can\_17\_McmCan\_Write API**

<b>Syntax</b>	<pre>Std_ReturnType Can_17_McmCan_Write (     const Can_HwHandleType Hth,     const Can_PduType * const PduInfo )</pre>
---------------	---

**1 Can\_17\_McmCan driver**
**Table 149 Specification for Can\_17\_McmCan\_Write API (continued)**

<b>Service ID</b>	0x06	
<b>Sync/Async</b>	Synchronous	
<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Reentrant.	
<b>Parameters (in)</b>	Hth PduInfo	Information which hardware transmit handle should be used for transmit. Implicitly this is also the information about the controller to use because the Hth numbers are unique inside a hardware unit. Pointer to the SDU user memory, DLC and Identifier
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	Std_ReturnType	E_OK: Write command has been accepted E_NOT_OK: Development error occurred CAN_BUSY: No TX hardware buffer available or pre-emptive call of Can_Write that cannot be implemented re-entrant.
<b>Description</b>	This function is used to transmit CAN/CAN FD frame based on the information passed to it. The CAN driver will only transmit messages with remote transmission request (RTR) bit at reset state (that is, no remote transmission request will be accepted by the CAN driver).	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	CAN_17_MCMCAN_E_PARAM_MSGID, CAN_17_MCMCAN_E_NOT_CONFIGURED, CAN_17_MCMCAN_E_PARAM_POINTER, CAN_17_MCMCAN_E_PARAM_HANDLE, CAN_17_MCMCAN_E_UNINIT, CAN_17_MCMCAN_E_PARAM_DATA_LENGTH, CAN_17_MCMCAN_E_PARAM_CONTROLLER

<b>Autosar Version</b>	Applicable for Autosar version 4.2.2.

### 1.3.4 Notifications and Callbacks

The CAN driver does not provide any notification or callbacks.

### 1.3.5 Scheduled functions

This section lists all the scheduled functions of the CAN driver.

#### 1.3.5.1 Can\_17\_McmCan\_MainFunction\_Read

**Table 157**      **Specification for Can\_17\_McmCan\_MainFunction\_Read API**

<b>Syntax</b>	<pre>void Can_17_McmCan_MainFunction_Read (     void )</pre>	
<b>Service ID</b>	0x08	
<b>Sync/Async</b>	Synchronous	
<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Non Reentrant	
<b>Parameters (in)</b>	-	-
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	void	-
<b>Description</b>	This main function performs the task of processing all the HRH objects configured as polling and if respective messages are received will provide notification to upper layer.	

## 1 Can\_17\_McmCan driver

**Table 157 Specification for Can\_17\_McmCan\_MainFunction\_Read API (continued)**

	<p>The function performs the polling of receive indication when CanRxProcessing is set to POLLING or MIXED. In case of MIXED processing only the hardware objects for which CanHardwareObjectUsesPolling is set to TRUE shall be polled. The function is implemented as an empty define if none of the RX processing for any of the configured controllers or hardware objects (in case of mixed mode) is chosen as POLLING.</p> <p>In case the value of CanMainFunctionRWPeriod is 0 or 1, Can_17_McmCan_MainFunctionRead is used. In case it is greater than 1, Can_17_McmCan_MainFunctionRead_(x) is used.</p>

### 1.3.7 Callout

This section lists all the callout of the CAN driver.

## 1 Can\_17\_McmCan driver

### 1.3.7.1 LPDU\_CalloutName

**Table 174 Specification for LPDU\_CalloutName API**

<b>Syntax</b>	<pre>boolean LPDU_CalloutName (     const Can_HwHandleType Hrh,     const Can_IdType CanId,     const uint8 CanDataLength,     const uint8 * const CanSduPtr )</pre>	
<b>Service ID</b>	0x20	
<b>Sync/Async</b>	Asynchronous	
<b>ASIL Level</b>	QM	
<b>Re-entrancy</b>	Non Reentrant	
<b>Parameters (in)</b>	Hrh CanId CanDataLength CanSduPtr	The hardware receive handle which will be passed to the upper layer The CAN message ID The data length of the message Pointer to the SDU structure which indicates the message data
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	boolean	TRUE: L PDU Callout function is successful FALSE: L PDU callout function is not successful
<b>Description</b>	<p>The AUTOSAR CAN module supports optional L-PDU callouts on every reception of L-PDU where LPDU_CalloutName has to be substituted with the concrete L-PDU callout name which is configurable. If the L-PDU callout returns false, the L-PDU shall not be processed any further.</p> <p>The L-PDU callout function is mapped in a separate memory section.</p> <p><i>Note: The prototype is deviated from the AUTOSAR prototype. The Hrh is of type uint8 as per AUTOSAR however the number of HRH which is configured is more than 255. Hence, the type of Hrh is modified to be of Can_HwHandleType which can hold values uint8 or uint16.</i></p>

<b>CAN_17_MCMCAN_E_INIT_FAILED:</b> The error is reported in case the Can_17_McmCan_Init() API service is called with a configuration pointer which is NULL or the configuration is not the same as the intended core.	AUTOSAR	0xA	DET	0x9	DET

## 1 Can\_17\_McmCan driver

Error Name: Description	Source	Error ID (AS422)	Type (AS422)	Error ID (AS440)	Type (AS440)
<b>CAN_17_MCMCAN_E_PARAM_MSGID:</b> The error is reported in case the Can_17_McmCan_Write API service is called with an invalid CAN message identifier as its parameter, which is neither STANDARD nor EXTENDED.	IFX	0xD	DET	0xD	DET
<b>CAN_17_MCMCAN_E_NOT_CONFIGURED:</b> The error is reported in case the API service tries to use a controller which is not configured to the core which has invoked the service.	IFX	0x64	DET	0x64	DET
<b>CAN_17_MCMCAN_E_MASTER_CORE_UNINIT:</b> The error is reported by the Can_17_McmCan_Init() API service in case the master core is in uninitialized state and a slave core initialization is invoked.	IFX	0x66	DET	0x66	DET
<b>CAN_17_MCMCAN_E_SLAVE_CORE_INIT:</b> The error is reported in case the Can_17_McmCan_Deinit() API is invoked by the master core before de-initialization of the slave cores is completed.	IFX	0x67	DET	0x67	DET

### 1.3.9 Deviations and limitations

The section describes the deviations and limitations of the CAN driver.

#### 1.3.9.1 Deviations

The section describes the deviations of the CAN driver.

##### 1.3.9.1.1 Software specification deviations

The section describes the deviations from software specification.

**Table 175 Known deviations**

Reference	Deviation
Specification of CAN Driver AUTOSAR Release 4.2.2 - [SWS_Can_00360] : Can_CheckWakeup.	The CAN driver does not support the Can_17_McmCan_CheckWakeup() API listed in AUTOSAR. The CAN driver does not support wake

**1 Can\_17\_McmCan driver**
**Table 175 Known deviations (continued)**

Reference	Deviation
Specification of CAN Driver AUTOSAR Release 4.4.0 - [SWS_Can_00360] : Can_CheckWakeup.	up from sleep over the CAN bus. Hence, the configuration parameter CanWakeupFunctionalityAPI that is associated with the enabling of the Can_17_McmCan_CheckWakeup() API is made non-editable.
Specification of CAN Driver AUTOSAR Release 4.2.2 - [ECUC_Can_00480]: CanControllerTrcvDelayCompensationOffset	For CanControllerTrcvDelayCompensationOffset parameter, the range has been extended to 65535 in order to accommodate CAN FD with the higher baudrates of > 2Mbps.
Specification of CAN Driver AUTOSAR Release 4.2.2 - [SWS_Can_00420] : The Can module shall reset the interrupt flag at the end of the ISR (if not done automatically by hardware). Specification of CAN Driver AUTOSAR Release 4.4.0 - [SWS_Can_00420] : The Can module shall reset the interrupt flag at the end of the ISR (if not done automatically by hardware).	RF0WE, RF1WE, RF0FE, RF1FE, TEFN, BO and DRX are the interrupts configured for the CAN module, in-order to ensure that the successive events are registered in IR during the processing of interrupts of previous received messages, interrupt flags are cleared at the start of the ISR. Note that the BO is the only exception and clears the interrupt at end of the ISR.
Specification of CAN Driver AUTOSAR Release 4.2.2 - [SWS_Can_00443] : The L-PDU-Callout prototype. Specification of CAN Driver AUTOSAR Release 4.4.0 - [SWS_Can_00443] : The L-PDU-Callout prototype.	As per AUTOSAR SWS, the LPDU callout prototype should be: <pre>boolean LPDU_CalloutName ( uint8 Hrh, Can_IdType CanId, uint8 CanDataLegth, const uint8* CanSduPtr )</pre> cannot hold all the HRH ids as it is possible to configure more than 255 hardware objects. Hence the proposal is to have HRH of Can_HwHandleType. This will be inline with the number of hardware objects which can be configured. Hence the prototype is defined as: <pre>boolean LPDU_CalloutName ( Can_HwHandleType Hrh, Can_IdType CanId, uint8 CanDataLegth, const uint8* CanSduPtr )</pre>
Specification of CAN Driver AUTOSAR Release 4.2.2 - Can_SetlcomConfiguration	For the API Can_SetlcomConfiguration, as per AUTOSAR 4.2.2 has a service ID 0xf which is also the service ID for Can_SetBaudRate. In AUTOSAR 4.4.0 the service ID correction for Can_SetlcomConfiguration was done and was modified to 0x21 so that it did not conflict with Can_SetBaudRate service ID (0xf). Hence the Can_SetlcomConfiguration has the service ID 0x21 in both AUTOSAR versions.
Specification of CAN Driver AUTOSAR Release 4.2.2 - [SWS_Can_00091] : After return of the DET the Can module's function that raised the default error shall return immediately.	After detection and reporting of CAN_E_DATA_LOST, CAN driver continue the operation to read and clear the FIFO for further working of CAN driver. If the function raising this DET returns immediately, then further operation is stopped forever until CAN driver is initialised again. No functional impact seen due to deviation of this requirement.

---

**1 Can\_17\_McmCan driver****1.3.9.1.2 VSMD Violations**

This section describes the violations reported by the EB VSMD checker tool with respect to AUTOSAR.

**1.3.9.2 Limitations**

The section describes the limitations of the CAN driver.

**Table 176 Known limitations**

Reference	Limitation
CanIf_RxIndication	CanIf_RxIndication contains the pdu information stored in the CAN driver internal memory so the upper layer must make a copy of pdu information once the CanIf_RxIndication is called by the CAN driver and should not be reusing the pointer passed by CAN driver.
RX FIFO handling in Interrupt mode	In the CAN driver for handling Rx FIFO through interrupt mode, watermark and FIFO full conditions are enabled. Rx FIFO interrupt processes maximum of configured FIFO elements. If messages are received while the Rx FIFO messages are being processed and if the number of messages in FIFO always stay above the configured threshold level during interrupt handler processing then watermark interrupt will not be triggered again. Therefore all messages will be processed only on FULL interrupt.
